## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Rabbit Skins

I have been sending rabbit skins to fur dealers and lately have had trouble with fur falling out. What can I do to prevent this?—Subscriber.

Both cottontail and jackrabbits should be skinned entire with exception of head and feet, dried flat without salt or any treatment. I have never had any trouble with the hair coming out, but of course in the molting season the rabbits would shed the hair easily. Most all of the fur dealers, especially those of St. Louis, would like to receive rabbit skins by the carload. They are used for lining aviation coats and it is our duty to get the skins to market if possible.—D. A. Gilchrist, Biological Assistant, United States department of agriculture, in charge of rodent control, Arizona.

### Nematodes

There is a belief held here by some that Blackeye beans will bring disease into the ground, I believe they call it nematodes. If I plant Blackeyes is there danger of introducing this disease?—Subscriber, Coachella Valley.

Nematodes is the name of a microscopic insect which is not introduced by the seed. If the soil is infested with these worms they will enter the roots of any plant, especially beans, causing root knots or galls, which greatly reduces the vitality of the plant. The same pest affects cotton, watermelons, tobacco, and other plants. Unless the pest now infests the ground we would plant beans or any other crop.

### Aphis

What can be done about aphis on a rundown place where trees and vegetables have been sprayed once but are still covered with aphis? What shall I use for spraying orange trees, and when?—Subscriber, Downey.

The tobacco extract—soap spray, the formula for which has often been given in the columns of the Cultivator, will control the aphis. Apply every few days, or as often as the aphis appear on the tips. As to spraying of orange trees, a question whose answer would have to cover such a wide range, we refer the inquirer to Cultivator special number on spraying, November 4, 1915. In a word, spray now with lime-sulphur, either dry or wet, for red spider. In mid-summer or fall, spray the various scale insects with any of the good contact insecticides.

### Irrigation

How much irrigation does field corn require? Will Sudan grass do well in very sandy soil? If planted about June 1 how much irrigation does it require, and can it be baled and kept for future use the same as barley or any other hay? Will horses eat it?—Subscriber, Downey.

Sudan makes a good hay though coarse and not equal to alfalfa. However, considering its large tonnage and its quick growth it is a very valuable hay. As to the amount of irrigation, it will range all the way from nothing to several thorough irrigations during the season. There are many soils which, if they have received thorough winter tilth, will carry sufficient moisture to mature one or two cuttings. There are other soils which are light and sandy with gravelly subsoil and so coarse that the water disappears by seepage and

evaporation, so that two irrigations per month might be necessary. But Sudan does not require such heavy irrigation as does alfalfa. If the soil has not received good tilth during the winter or after the rains fall, then a heavy irrigation before planting is necessary. One Imperial Valley planter recommends "heavy irrigation, plowing, another heavy irrigation, disking, another heavy irrigation, harrowing," and after such preparation he maintains the crop will grow without any further application of water. We may remark again, however, the nature of the soil is a determining factor.

### Olive Trees—Black Scale

Will olive trees breed black scale? Our grapefruit trees near them have black scale, yet we fumigate them. Would you advise cutting out the olive trees? Have well cared for three-year-old peach trees which have averaged up to this time a half dozen peaches and have very few leaves.—Subscriber.

Black scale manifests great liking for olive trees, but the control of scale on these trees should require no greater effort than on the grapefruit trees. Of course if the olives are not desired then they should be removed, but otherwise fumigation or spraying at the same time the grapefruit trees are treated would be best. Regarding the peach trees, three-year-old trees should not bear especially heavy crop of fruit, but they should have heavy growth of leaves. Possibly curl leaf has been so bad as to kill the leaves, or other trouble may have defoliated them, the cause of which only a study of the particular trees could determine.

### GROWING TOMATOES AT ELSINORE

M. R. Root of Head of the Lake tells how he has successfully grown tomatoes:

After determining the acreage to be grown, first secure one ounce of seed per acre. Use Stone variety for canning purposes, locate the seedbed convenient to water supply. Seedlings may be grown by two methods, first, by sowing seed thinly in rows 12 inches apart, irrigate by shallow furrows between rows. Second, by covering seedbed very thinly with fine fertilizer from the horse corral. Applying moisture by sprinkling, this slight covering of mulch prevents evaporation and crusting of the soil. When seedbed is thoroughly established, thin plants to three or four inches, thereby growing a short stocky plant, transplanting to field when four to six inches high. Moisten plant thoroughly when removing plants to prevent breaking roots. Tomato fields should be plowed deep, finely pulverized, then furrowed, after which a two inch dust mulch should be created to prevent evaporation. On the five acres of tomatoes I shall grow the land is heavy loam, moist; plants will be set nine by nine feet, requiring 537 plants per acre. Light soil say six by six feet, 1200 plants per acre. In planting to field abundance of moisture should be applied in all cases, plants should be set well down, as they are shallow rooted this prevents overheating the root system. Cloudy afternoons for setting out plants are desirable, after which, frequent shallow cultivation should continue until growth of plant prevents. Great care of vines in gathering fruit should be practiced to prolong the bearing season. In following the above suggestions remunerative crops should result.

I would suggest that inexperienced growers do not undertake too large an acreage on unproven tomato ground and locations. Have the acreage well distributed. One year's experience will demonstrate the profitable locations.

PLANT YOUR LAND NOW TO WINTER RHUBARB. You should get big crop by next fall. Others making \$1000 per acre, so can you with WAGNER'S GIANT—plant no other. Get your plants from originator and avoid disappointment. J. B. WAGNER, Rhubarb and Berry Specialist, PASADENA, CAL.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

## Vegetable Planting Calendar for June in Southern California

Written for California Cultivator  
By D. F. Reichard

ON ACCOUNT of weather conditions crops in general this year will be short and somewhat earlier than usual. It behooves all who can possibly do it to replant their spring garden with summer growing stuff as soon as space is made available (by the removal of maturing crops). While the dry-farmers and the grain and stock ranchers will not be able to respond with the full measure they had hoped, the home gardens and all who have sufficient water at their disposal can and will help to a remarkable degree by increased production to make up for this unavoidable shortage, not in the same products but in substitutes.

Where peas come out put in corn, two or more rows of a kind at a time, even though the rows are only eight or ten feet long. The reason for this is that a better pollination is obtained by the pollen being blown from one row to the other as well as along the rows. Oregon Evergreen and Heath's Early are the best of the available varieties. Plant three rows 15 feet long every two weeks till the middle of August for a continuous supply for a family of three.

Where your crop of potatoes has been growing replant with beans. For dry varieties plant one pound to about 300 feet of row, which under ordinary conditions should produce 50 pounds of dry beans. When planting green beans use either Stringless Green Pod bush or Kentucky Wonder pole at the rate of one pound to 150 feet of row. Plant melons, squash and cucumbers where hardy root crops have been growing. Replace surface crops with root crops.

To get the desired results from the summer garden the soil must be properly handled. As soon as the spring crop is harvested thoroughly soak the ground and work it up well leaving the surface as fine as possible. Get the seed into the soil at once before the moisture evaporates. Be sure to have the seed deep enough to be in continual moisture till near enough the surface so as to get air enough for perfect germination and growth. Under these conditions the various crops should show above the ground without any further wetting. When the young plants are up enough to show the rows cultivate and if necessary irrigate between the rows. As soon as the ground is in working condition work the irrigated part with the cultivator so as to keep a finely broken surface. This should be done after each irrigation.

### JUNE PLANTING IN ARIZONA

The immigration commission of Maricopa County has issued a planting calendar for Arizona which will be of interest to many of our subscribers. In the June planting list we find:

In May and June we plant:

#### Vegetable Seeds

Casaba, pumpkin, peanuts and squash.

#### Flower Seeds

Cosmos, morning glory, all vine seeds and zinnia.

#### Field Seeds

Cowpeas, feterita, kaffir, millet, Sudan grass, milo, sorghums and broom corn.

#### Fruits

Date plants.

We harvest: Tomatoes, melons, cucumbers, beets, carrots, onions, strawberries, blackberries, figs, plums, peaches apricots and apples.

### MARTIN LUTHER'S DIAGNOSIS OF GERMANY'S CASE

"In former times it stood well with Germany; but now her people are fallen from virtue, and are become rude and proud and insolent. Germany is like a brave and gallant horse, highly fed, but without a good rider. Germany is a rich, powerful, and brave country, but she is sore in need of a good head and governor. I often reflect with sorrow how utterly Germany rejects all good counsel in this respect."

## A Motor for Every Need

## California Cultivator

Costs Only \$1.00 Yearly

# 150,000 Farmers Quit "Guessing" When They Paid Our Dealers \$10,000,000 for "Z" FARM ENGINES

## 150,000 Farmers Chose These "Z" Engine FEATURES:

1. Fairbanks-Morse QUALITY.
2. Economical in first and fuel cost, and low up-keep.
3. Simplicity and staunch durability.
4. Light weight, substantial, fool proof.
5. Gun Barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

Economy and efficiency, with "more than rated power" in an engine is the war-time-demand of farmers of America.

They have "quit guessing"—they demand action, proof-performance on their kind of work.

So 150,000 leading owners have backed their judgment on the FAIRBANKS-MORSE "Z" Engine with \$10,000,000.

That's a lot of engines bought for reasons you'll find are wise ones.

## "Z" 3 & 6 H. P. ENGINE Uses Economical KEROSENE

Also Distillate, Coal Oil  
Tops or Gasoline

Kerosene, easy to get, at half gasoline costs, does the work in a "Z" with more than rated power. FAIRBANKS-MORSE engine designers saw this war-demand coming and built "Z" Engines to fit the farmers' needs. The farmers know it now—over 150,000 strong. Will you too investigate? Compare. Figure out the FACTS—before you buy ANY Engine. *Alright—we know the result, because—*

### You Also Get This Local Dealer Service

Go to the Fairbanks-Morse Dealer. He is in position to render you prompt and personal service. He has exactly the "Z" for your NEEDS in stock and can make quick delivery. See it in operation on his floor.

The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H. P. size uses gasoline only.

The Reliance Meter is recognized by water companies and irrigators to be the most accurate and impartial method of measuring water. Send for Copy of Water Watch.  
**Hydrometric Co.** 955 North Main St. Los Angeles Cal.

## Sprayers for Garden and Truck Farm

By A. W. Morrill

**E**VERY vegetable grower needs a sprayer of some kind nearly as much as a shovel or a hoe. The average person who attempts to grow vegetables without giving attention to insect pests loses each season many times as much as it would cost to purchase and use a good sprayer. On the other hand there is considerable loss due to the use of sprayers which are not suited or not properly equipped for the work attempted.

### Common Types of Sprayers

Atomizer sprayers of the right kind can sometimes be used to advantage in spraying a few garden plants but the use of even the best of this type of sprayer usually represents a loss rather than a saving owing to dependence being placed on it when a bucket pump or one of the types of larger capacity should be used. Atomizer sprayers are of many different patterns and cost from 50 cents to \$1.00 each. In the writer's opinion they are all undesirable or worthless for garden use except the kind which gives a continuous spray and which has an extra cap or nozzle so that the spray may be directed either straight or at an angle. This angle cap makes it possible to reach the under sides of the leaves of low growing garden plants. This is an essential of all good garden sprayers.

Bucket pumps, properly equipped, are very useful in garden work and every gardener and truck grower needs one unless already provided with something better. Bucket pumps are sold by dealers at prices ranging from three to six dollars but usually they are poorly equipped for garden use. Unless properly equipped they are practically worthless for spraying purposes. Information concerning the equipment needed for this and other sprayers is given in another paragraph.

One of the most popular types of garden sprayers is the compressed air sprayer. The tanks are usually three and one-half or four gallons total capacity and are filled about two-thirds full of liquid. The desired pressure is obtained by means of an air pump and while in use the sprayer is carried under the arm by means of a shoulder strap. Fully equipped compressed air sprayers of this type cost from six to ten dollars. These compressed air sprayers have almost entirely taken the place of the knapsack type of sprayer which is carried on the back and requires continuous pumping by means of a handle which hangs down in front.

Hand lever pumps, wheel-barrow type, with tanks of a capacity from ten to 15 gallons can be used in spraying small home orchards as well as garden crops. One of the best of these sprayers with a small capacity nozzle can be used with 175 to 200 pounds pressure but for ordinary use from 75 to 125 pounds pressure, according to the nature of the work, is sufficient. This type of pump should have a mechanical agitator and a pressure gauge. When not supplied with the pump these gauges cost from \$2.25 to \$3.00 extra. A pressure tank attachment giving the advantages of a compressed air sprayer is well worth the additional cost of from \$4.50 to \$5.00. This pressure tank makes continuous pumping unnecessary. Fully equipped pumps of this type cost from \$25 to \$35.

In spraying large acreages of vegetable crops either barrel pumps or large capacity hand lever pumps are recommended. The latter are usually double action with horizontal cylinders. Such sprayers are mounted in wagons or on special carts and may be equipped for spraying from four to six rows at a time. Good barrel pumps usually sell between \$20 to \$25 mounted on a barrel and fully equipped. The large hand pumps fully equipped usually cost between \$30 and \$50.

One and two horse traction sprayers for spraying four to six rows of potatoes or other field crops cost from \$115 to \$150 fully equipped. These are provided with pumps geared to the wheels and can be operated with one man to a sprayer. The saving in labor expense and time in spraying large acreages soon offsets the dif-

ference in the cost between this and a cheaper outfit.

### Equipment for Sprayers

Bucket pumps and the small portable compressed air sprayers should in each case be equipped with three feet of three-eighths or one-half inch rubber hose, a three-foot brass extension rod, a right angle elbow joint and a nozzle. Certain nozzles are fixed at right angles (such as the side cyclone nozzles) while one has a swivel joint and can be directed at either 45 degrees or at a right angle. In such cases the right angle elbow joint is unnecessary. The nozzles which are ordinarily termed angle nozzles direct the spray at an angle of 45 degrees from the extension rod. For garden or truck farm use these should be combined with 45 degree elbow joints in order that the spray may be directed at an angle of 90 degrees from the spray rod.

The compressed air sprayers and larger types should have a shutoff connection located between the hose and the extension rod. A shutoff is useful but not necessary with the bucket pump.

The hose equipment should vary according to the pump used. Three feet is of sufficient length for a bucket pump or for a compressed air sprayer. The wheel-barrow type and larger sprayers should be provided with two leads of hose from ten to 20 feet long in each case. Heavy hose such as is used in high pressure spraying in orchards should not be used with garden sprayers since light hose, three-eighths or one-half inch size, can be handled in the field with less injury to the crops. Hose suitable for bucket pumps and compressed air sprayers costs from 15 to 18 cents a foot and for larger types of sprayers from 18 to 25 cents a foot.

The equipment mentioned above for spraying several rows of crops at a time is known as a row sprayer attachment or spray boom. Such attachments are listed by most spray pump manufacturers. The cost is usually between \$12 and \$15, including the nozzles.

A common mistake made by manufacturers of spray apparatus consists in supplying two-foot extension rods with garden sprayers instead of three-foot extensions. Another common mistake consists in supplying extension rods made of ordinary gas piping or equally heavy brass. Unnecessarily heavy rods are tiresome to handle and in the long run will not be handled as effectively as reasonably light rods. Brass rods should weigh only three to three and one-half ounces to the foot. This is about one-half as much as ordinary gas pipe rods. Aluminum rods are preferable to iron rods and are lighter but not as strong and will not last as long as brass rods. Extension rods for bucket pumps and compressed air sprayers should be made of quarter inch pipe with standard male thread at the outer end of the attachment of any standard nozzle or elbow joint. When a wheel-barrow type sprayer or a sprayer mounted in a wagon is used and it is desired to reach several rows of vegetable crops at a time brass lined bamboo extension rods should be used. Ordinarily eight-foot extensions are the most convenient size for such field work. In spraying tall trees extensions ten to 12 feet long are needed. The best brass and aluminum extension rods for bucket pumps and compressed air sprayers usually cost 25 cents a foot. Brass or aluminum lined bamboo extension rods for larger sprayers cost between 30 and 35 cents a foot.

It is impossible to define in a precise way the requirements of a spray nozzle suitable for garden and truck farm use. Generally speaking a nozzle suitable for such use should throw a fine and fairly uniform circular spray with a broken spray in the center and with a spread of about 70 degrees under pressure as low as 50 pounds. For ordinary purposes the nozzle should be of comparatively small capacity or less than one-half that of the large nozzles used with high pressure in orchard spraying. Nozzles which are suitable as to capacity range from 3-13 minutes to 4-16 minutes in discharging a gallon

of spray when operated with 50 pounds pressure. In gallons per minute this is equivalent to .24 to .3 gallons per minute or, roughly, between a fourth and a third gallon. In the matter of spreading, the best nozzles of several recently tested gave a spread of about 17 inches at a distance of 12 inches from the nozzle opening. In testing several nozzles which were satisfactory in the point of capacity a variation between 14½ to 17½ inches in the spread of the spray one foot from the nozzle opening was observed. A nozzle which discharges more than a third of a gallon of liquid in one minute under 50 pounds pressure and spreads the spray less than 14 inches at a distance of 12 inches should be regarded as unsatisfactory for spraying vegetable or garden crops. The spread of spray from a nozzle can be measured conveniently by laying the extension rod flat on the ground with the nozzle directed parallel with the ground and at the edge of a smooth dry area. After spraying for a few seconds the measurement of spread at the distance of one foot can readily be made. The capacity per minute can be determined easily by measuring the spray discharged at the given pressure. Nozzles which throw a flat fan-shaped spray such as the Bordeaux, are not recommended for garden or truck farm use. Nozzles of the Vermorel type usually throw the spray in the form of a hollow cone. The type of nozzle with a large eddy chamber and changeable discs with openings of two sizes, one for coarse and one for fine spray, throws a more evenly distributed spray than other common types.

Manufacturers sometimes make changes in their nozzles which affect their capacity and the type of spray which they throw. Furthermore nozzles vary considerably owing to imperfections. A disc type of nozzle, for example, throws a very imperfect spray when the opening in the disc is irregular or not perfectly centered. For these reasons it is unwise to recommend special nozzles. Nearly all of the leading spray pump manufacturers list in their catalogues a number of kinds of nozzles, among which one or more are generally suitable for use in spraying vegetable crops.

Those who buy direct from manufacturers should read carefully the specifications as given in the catalogues and in ordering state the use to which the sprayers are to be put. It is always desirable to have on hand more than one type of nozzle, and the adaptability of each type for different uses should be determined by special tests.

#### FARM IMPLEMENT INDUSTRY TO BE LICENSED

Presidential proclamation signed May 14, 1918, requires all individuals, partnerships, associations and corporations, except those specifically exempted by the food control act, engaged in the importation, manufacture, storage and distribution of tools, utensils, implements, machinery and certain other farm equipment, to secure federal licenses not later than June 20, 1918.

The secretary of agriculture is directed to carry out the provisions of the proclamation and the regulations thereunder. Licensees are required to furnish information regarding their businesses whenever it is thought necessary by representatives designated by the secretary, and must permit such representatives to inspect the property and records pertaining to their business. Information obtained in this manner is not to be disclosed without authority. Unjust profits, resales within the trade without reasonable justification, attempts to monopolize, unreasonable increase of prices or restriction of supplies, and willful waste of farm equipment are prohibited. Also, licensees are forbidden to sell farm equipment to persons known to have violated the food control act.

Applications for licenses must be made to Law Department, License Division, United States Food Administration, Washington, D. C., upon forms prepared for that purpose.

The Italian minister of agriculture has made obligatory the cultivation of certain staple food crops in excess of quantity formerly grown.

## Cut the Cutworms

Cutworms used to cut off my young garden plants, but of recent years I have used a method which prevents this injury. When transplanting cabbage and tomatoes I wrap a small piece of paper, three and one-half by four inches, around the stem. When the plant is set out one-half of this collar of paper extends beneath, and one-half above the ground. This prevents the cutworm from getting to the stems and is excellent insurance against these insects. I have never lost a plant wrapped with paper and consider this method of protection practical for the average farm and backyard garden.

In large truck patches and in the cornfields I have killed these worms quickly by means of poison bran mash scattered very thinly along the rows of corn or vegetables. The formula now used is as follows: Bran, one peck; Paris green or white arsenic, one-fourth pound; cheap syrup of molasses, one pint; two oranges or lemons (ground or chopped fine); water, three-fourths gallon. Mix the dry bran and poison thoroughly, then

sprinkle over it the sweetened liquid made by stirring the syrup and ground fruits in the water. The bran should be stirred while the liquid is being added, and then mixed with a trowel or hoe for a few minutes. This bait is scattered very thinly in the evening and is an effective poison with which to kill the worms. They feed at night, and by the next afternoon their dead bodies can be found on and beneath the surface of the ground. I use this method in my garden whenever the worms are cutting off plants grown from seeds and which have not been protected by the paper collars. I try to scatter the mixture too thinly for chickens to pick up, but am careful not to let the chickens feed where this poison has been spread.—Agricultural College Extension Service, Ohio State University.

Ukraine stocks of wheat amount to approximately 48,000,000 bushels, according to information reaching the food administration. The north ports of Russia, however, are bare of supplies and the past winter has been very unfavorable to agriculture.

#### FARM SPECIALISTS

In our little town, oh! sad to tell,  
There's a merchant who doesn't know  
how to sell,  
A sawyer who doesn't know how to saw,  
A teacher who doesn't know how to  
teach,  
A preacher who doesn't know how to  
preach,  
A painter who can't paint very well,  
A printer who doesn't know how to spell,  
An odd-jobs man with never a job,  
A cobbler who doesn't know how to cob,  
A miller who doesn't know how to mill,  
A butcher who doesn't know how to kill,  
A racer who doesn't know how to race,  
A mason who doesn't know how to mace,  
A clocksmith who can not mend a clock,  
And a doctor who doesn't know how to  
doc;  
And, since none of these are busy men,  
You will find them again and yet again,  
Ever anon and a few times more,  
'Round the stove in Mendolsen's store,  
Each talking freely and through his hat,  
Doing the one thing they are expert at,  
Giving advice to farmers.  
—The Prairie Farmer.

Much of the acreage formerly allotted to melon growing in Italy will be put under wheat this year, according to reports received by the United States food administration. Native supplies of wheat in Italy are light.

The United States is obligated to send 1,000,000 tons of food each month to the Allies and is going to do it.

## With Self Starter and Electric Lights

Here's what one man and a Moline-Universal Tractor can do in one day of 10 hours:

- Plow 7 to 9 acres.
- Disc 27 acres with a 7-ft. tandem disc.
- Disc 38 acres with a 10-ft. disc.
- Harrow 76 acres with a 20-ft. peg tooth harrow.
- Plant 22 acres with a two-row planter.
- Plant 43 acres with a four-row planter.
- Cultivate from 14 to 20 acres with a two-row cultivator.
- Drill 35 acres with a 10-ft. grain drill.
- Harvest 25 acres with an 8-ft. grain binder.
- Harvest 10 acres with a corn binder.
- Mow 25 acres with an 8-ft. mower.
- Rake 40 acres with a 12-ft. rake.
- Rake 25 acres with an 8-ft. side delivery rake.
- Load 12 acres of hay.

In addition, it can be used on the belt for running threshers up to 24 inch capacity, silo fillers, corn shellers, feed grinders, wood saws, clover hullers, hay presses, pumps, lighting plants, etc.

There is no end of odd jobs that can be done with the Moline-Universal Tractor.

## Announcing the New MOLINE UNIVERSAL TRACTOR

### Model D

**B**ECAUSE of its ideal design, construction and performance, this new Moline-Universal Model D enables one man to farm more land and produce more food than ever before possible. It is the world's most dependable farm hand and solves the farm help problem.

#### Most Advanced Construction

New features include self-starter, electric lights, electrical governor, perfected overhead valve, four-cylinder engine that is free from vibration; complete enclosure of all moving parts; differential lock which increases traction in soft ground.

Every part is designed on the basis of quality and service. Drop forgings, heat-treated parts, steel cut gears and unusually large bearings add extra years of endurance.

These new features, together with the well known Moline-Universal type—all the weight on two wheels, one-man control and ability to do all farm work including cultivating—make the Moline-Universal Model D the best tractor that money can buy.

#### Phenomenal Pulling Power

Of its total weight of 3380 lbs., 98% is used for traction. That's why the Moline-Universal has phenomenal pulling power.

Conservatively rated at 9-18 horse-power, the Moline-Universal Tractor has more than ample power for heavy belt work. Its greater speed enables it to plow as much in a day

with two plow bottoms as the ordinary three-plow tractor. Yet it is light enough for such work as cultivating, mowing, etc., which do not require as much power.

#### One Man Operates Entire Outfit

The Moline-Universal attaches direct to the implement, forming one compact unit. It turns in a 16-foot circle and backs with the implement attached as readily as it goes forward. One man has complete control of the entire outfit from the seat of the implement and can thus do the same work that requires two men with other tractors. Operation of the Moline-Universal is so easy that a woman or boy can handle it.

In fact anyone who can drive an automobile can run a Moline-Universal Tractor.

#### Moline Tractor Implements

The greatest care has been used in designing a full line of implements for use with the Moline-Universal. "Moline" trademark on a tractor or implement is a guarantee of dependable service.

Moline dealers are now accepting orders for Model D Tractors, and our new and modern plant—the world's largest exclusive tractor factory—is being crowded to the limit in an effort to build tractors fast enough to keep pace with the demand.

On request we will be glad to send you our Tractor Catalog which completely describes the new Moline-Universal. Address Dept. 49

## Raising Dairy Calves

By C. V. Castle at Dairy Conference

HE problem of what to do with dairy calves is becoming more acute, as feed becomes higher and human food scarcer, and it is hard to decide what to do with some of the less valuable animals.

In raising the grade bull calves and undesirable heifer calves for veal, the best plan is to keep them entirely on whole milk and by feeding them heavily on it, get them to market as rapidly as possible. If the calves are big to begin with, you will likely make some profit; if small they will very likely be fed at a loss.

Where pasture is available some may be able to do better by raising these calves on skim milk and mar-

getting the calves over on the skim milk. The calf should know how to eat grain before making the change so that the starch in the grain may take the place of the butter fat removed from the milk in skimming. Skim milk is rich in protein and the starchy grains such as corn, barley, milo, and the mill feeds and dried beet pulp. From two and one-half to three pounds of such feeds will take the place of a pound of butter fat when fed with skim milk.

About a week should be ordinarily used in getting calves on to skim milk. A good plan is to substitute rather rapidly skim milk for whole milk until you are feeding about half and half, then wait a few days until the

Twin Helpers

Sired by King Korndyke Sadie Vale and out of Sunnyside Johanna Queen.

keting them as yearlings or two year olds.

In most cases only heifers from the best cows or pure bred heifers and bulls can be profitably kept past the veal age. Veal calves it is generally cheaper to feed heavily and get to a marketable age as soon as possible. With calves that are to be kept, ten to 12 pounds of whole milk for the larger calves and eight to ten pounds for the smaller, will give satisfactory results. Most calves will be ready to put on skim milk at eight weeks and many will do to put on skim milk a few weeks younger. With some pure breds it may be best to keep them on whole milk until three months old.

After a well grown calf is two to three months old it is a whole lot cheaper and probably better for the calf to be placed on skim milk. Calves fed on skim milk probably supplemented with grain will very often make larger gains than those fed on whole milk, and at the same time they are compelled to eat liberally of hay which develops their capacity.

Considerable care must be used in

calf begins to adjust itself to the new ration, then continue to substitute skim for whole milk until it is entirely on skim milk. No more skim milk should be given at first than whole milk was given. A calf can generally stand more whole milk than skim milk because of the laxative nature of the latter. Many feeders make the mistake of changing from a gallon of whole milk per day to two gallons of skim milk within a few days time. Increase the skim milk gradually until 14 to 16 pounds are being fed at the age of two to three months. Older calves can take care of larger quantities of milk than this although 16 pounds a day is a good average feed. Calves six to eight months old can drink 25 to 30 pounds of skim milk although where hogs are kept it is perhaps better economy not to feed quite so heavy. Alfalfa hay is perhaps the best hay for calves although with young calves, just changed on to skim milk, it is likely to prove too laxative. This feature can be eliminated by limiting the amount of hay fed or by feeding

Over a Thousand Dollars Worth

The youngster on the left sold some years ago for \$1000. She is a daughter of King Korndyke Sadie Vale. The other is a daughter of the same sire.

every other feed of oat hay or clean bright straw.

The amount of grain to feed depends upon several conditions, that is, value of the grain, value of the calf, etc., but as a rule young calves should get one-half to one pound of

grain daily, while larger ones should get from one to two pounds daily. The grain should not be fed in the milk but after the milk has been drunk. In this way the calf chews it better, and the grain dries out the calf's mouth and makes it forget the desire to suck another's ears.

In making a grain mixture for young calves quite a bit of attention must be paid to palatability as many small calves do not care for grain if it doesn't taste right. Barley, milo, or beet pulp will serve well for the bulk of the mixture, with a certain portion of bran, middlings or coconut meal added to make it more palatable. Calves like a rather light mixture with a certain amount of finely ground material which gives them the taste quicker than barley or oats, and for this purpose bran, middlings, or coconut meal serves very well. Linseed meal helps the palatability of a mixture and gives the calves a very thrifty appearance but for ordinary purposes there is nothing gained in feeding it. Middlings is a great feed for calves but it is too heavy to feed very much of it in a mixture. A rather cheap mixture would be dried beet pulp one part, crushed barley one part, wheat bran one part, coconut meal one-half part.

With present prices for grain feeds, and the high prices paid for milk and milk products, the tendency is to slight the calves. I do not think we are wise in doing this, and if we must cut down on feed bills, do it by culling out the poorer calves. One heifer of the right breeding and well grown, is better than three ordinary heifers for milk production in that she will make a neat profit, while two out of three ordinary heifers will not more, than pay for their keep, with their first calves. The length of time to continue feeding skim milk to calves depends upon several conditions, but in general, they should be fed skim milk until they are at least six months old and better yet until eight to ten months old. Calves born in fall and winter will be large enough by late spring to turn out to grass but spring calves miss the green grass and should have milk longer before trying to winter them on dry hay or pasture. It is poor practice to turn a bunch of calves out to shift for themselves after they have been weaned from milk, unless it be on to good green pasture, because at this age they should be pushed ahead and should not be allowed to become stunted. The right kind of a dairy heifer will not get fat enough to hurt her and heavy feeding develops the capacity of the heifer and gets her used to handling large quantities of feed.

The size of calves at different ages will depend upon the breed as well as upon the way they have been raised. Here at Davis, 18 heifers, of four different breeds weighed on the average 533 pounds at an average age of ten months. The largest weighed 800 pounds at ten months, and the smallest 375 at nine months. One Holstein bull calf weighed 724 pounds at seven months. In the well bred and well raised heifer calf lies the road to improvement in our dairying.

#### ABERDEEN-ANGUS IN CALIFORNIA

Foundation for a great Aberdeen-Angus herd is being laid on the Verdo B. Gregory ranch at Oakdale, Stanislaus County. Captain Gregory recently purchased from one of the leading Aberdeen-Angus herds in the state of Washington a bull and ten cows from the Congdon and Battles ranch. Captain Gregory has seen many years' service in the United States army and is now at the head of a large hospital at Joseph, Oregon, but is giving much attention to his Stanislaus ranch, where he has over 200 acres of irrigated land besides range land.

"I want to give California the greatest beef herd in the West," said Captain Gregory in telling why he chose Aberdeen-Angus for his farm. "The Aberdeen-Angus by their winnings at the world's greatest shows of cattle have demonstrated their supremacy in beef making. I have a theory that California climate, soil and breeders can take the best and beat the best from other sections of the world. This is a time for sound breeding work, and I have therefore chosen a practical herd rather than a kind better fitted as the plaything of a millionaire."

## Dehorning Cattle

Dehorning cattle is almost universally practiced by stockmen who raise high grade steers. Cattle without horns are easier to handle, have an equal chance at the feed trough when placed in the feed lots, are less dangerous to attendants, and are more uniform in appearance. Also, they can not gore one another in the feed lot or in transit to market, which causes greater shrinkage in weight, injures the skin for commercial purposes, and leaves the flesh in a bruised condition, thus detracting from its value.

### A Simple Method

While there are many cruel ways of performing this operation, one of the simplest and easiest methods is to use caustic, either soda or potash, on the undeveloped horns of the calves. To obtain the best results the caustic should be applied when the calf is from four to ten days old. Clip the hair from around the knobs where the horns are developing. With a slightly moistened stick of caustic, rub each horn alternately three or four times, allowing it to dry each time before applying the next. Extreme care should be taken not to have the stick so wet that the solution from it will run down the side of the calf's head. To prevent the spread of the caustic, which will cause sores on the skin, apply vasoline around the edge where the hair has been clipped.

For older cattle, where the horns

have developed, either saws or clippers should be used. It is best to use the clippers on the young animals when the horns are still soft and tender, but with older animals which have hard, brittle horns the saw should be used. While the operation can be performed with clippers quicker and with less pain, this instrument is liable to crush the bone in older animals, causing a wound that heals very slowly.

### Time to Perform the Operation

Cattle should never be dehorned during warm weather, spring being the best time to perform the operation. If delayed too long in the season, the wound may become infested with screw worms, and flies are very annoying. Either coal tar or pine tar applied to the wound will prevent fly injury. If screw worms appear in spite of all precautions, they may be removed by saturating a piece of absorbent cotton in chloroform and inserting it into the wound, or by pouring gasoline into the wound. This kills the worms, which should then be removed with a pair of forceps.

In order to make a clean cut and avoid trouble in performing the operation, the animal's head should be held in a firm position. For this purpose dehorning chutes, the front of which consists of two strong pieces which can be closed firmly on either side of the cow's neck, are very convenient.

## Thirty Forty Pounders

Thirty pure bred Holstein cows now have achieved the proud distinction of having produced more than 40 pounds of butter in seven days. The two latest matrons of the dairy world to achieve such fame are Korndyke

pounder, freshened at the age of six years, one month, 27 days. She completed her seven day test with 649.6 pounds of milk yielding 40.14 pounds of butter.

Her sire is Woodcrest Nig De Kol,

Korndyke Winona

Winona and Segis Hengerveld Fayne Johanna.

Korndyke Winona freshened at the age of eight years, 23 days, and produced in seven consecutive days 683.4 pounds of milk yielding 40.28 pounds of butter. Her sire is Pontiac Korndyke and her dam is Miss Winona Mechthilde. She was bred by Charles H. Hyde, Watertown, New York.

Segis Hengerveld Fayne Johanna, the thirtieth "Black-and-White" 40

her dam is the great world's champion, Segis Fayne Johanna, the first and only cow of any breed to yield 50 pounds of butter in a week. She was bred by A. A. Cortelyou, Somerville, New Jersey.

Each of these great cows has yielded in seven days an amount of butter that it would take ten average cows to produce. Both are now owned by Pine Grove Farms, Elma Center, New York.

## The Efficient and Economical Jersey

Written for California Cultivator

**F**OR several years the Ohio agricultural experiment station has been collecting data to determine actual conditions existing on Ohio dairy farms. From investigations completed last fall it has published a summary of the results obtained as to the comparative economic production of milk and butter fat by large and small dairy cows. The Jersey represented

the small type. A number of herds were included in this investigation, located in different parts of the state. In this test for economic production, 371 Jerseys and 342 large type were used. The amount of feed consumed and amount of milk produced daily by each animal were accurately recorded.

I have not seen mention of this investigation in any of the California papers. It seems to me that in these

days of extremely high priced dairy feed the results of an investigation into the economic production of different kinds of dairy cattle by an institution of the character of the Ohio experiment station should receive due publicity, for at this time most dairy-men are particularly interested in economic production.

An announcement of the results of these investigations is published in the experiment station's bulletin of October, November and December,

The maintenance ration required for a Jersey is less, therefore from an equal amount of feed supplied to each breed, the Jerseys have more left for the production of milk solids and butter fat after using the amount required to maintain their bodily and working strength. For the entire lactation period as shown by the Ohio investigation, the Jerseys consumed only 75 per cent as many pounds of digestible nutrients for each pound of butter fat production as did the large type.

Handsome is as Handsome Does

1917. A lactation period of ten months was considered. It was found that the Jerseys produced milk solids slightly more economically than the large type and produced butter fat considerably so. The illustration employed to express the difference is as follows: Considering the Jerseys 100 per cent efficient in the economic production of milk solids, in comparison the large type were 93 per cent efficient; considering the Jerseys 100 per cent in the economic production of butter fat, the large type were but 74½ per cent efficient.

The best Jerseys required 3.3 pounds of digestible nutrients for each pound of milk solids they produced. The best large type required 3.9 pounds of digestible nutrients for each pound of milk solids produced. The poorest Jerseys required 9.4 pounds and the poorest large type 11.8 pounds. Even when the amount of feed required for the maintenance of the animals was deducted, that is, nothing charged to maintain life and strength, it was found that the Jerseys produced butter fat more economically.

## Making Cottage Cheese

Cottage cheese is a valuable food and should be used in larger quantities than it is at the present time. It is comparatively cheap and may be substituted to a large extent for meats. Large quantities of skim milk now being used on farms for other purposes could be profitably turned into cottage cheese.

For the manufacture of cottage cheese, says L. G. Rinkle of the University of Missouri college of agriculture, fresh, sweet, skim milk should be used. Warm it to a temperature of 70 degrees Fahrenheit and let stand until it forms a curd. This will require from 12 to 18 hours. The curd should be smooth and soft, but firm. It should not stand until it begins to shrink and whey off, for then it will become too sour and tough when made into cheese.

After a good curd has formed, break it up gently and warm to 90 degrees Fahrenheit. This should be done very slowly and evenly. Allow the curd to stand at 90 degrees Fahrenheit for ten to 15 minutes, then pour out into strainer cloths. A heavy quality of cheese cloth serves best as a strainer. Flour or salt sacking is too heavy. The strainer is made by taking a square piece of heavy cheese cloth and tying opposite corners together. This forms a bag or sack.

The cheese should be hung up in a cool place and allowed to drain for several hours. When sufficiently drained the curd should have the consistency of thick mush. Care should be exercised to avoid overdraining as a dry cheese will result.

After draining, the cheese should have salt added at the rate of one ounce per ten pounds of cheese. Cream is sometimes added to give the cheese a richer flavor, but this practice is expensive.

Cheese cartons or containers make attractive packages in which to sell the cheese. It may however, be sold in crocks but should not be put up in tin containers.

Three or four precautions are necessary in making cottage cheese:

Don't let the curd get too old or sour before the cheese is made up.

Don't heat the curd above 90 degrees Fahrenheit as a tough cheese results.

Don't heat the curd too long as a

tough cheese results.

Don't hang the curd in a warm place to drain, because it will become sour.

A Rambouillet ram at the University Farm has just produced 30 pounds of wool in exactly 365 days. This fleece would have been worth \$18 if sold at the time of shearing when wool was worth 60 cents per pound. This performance gives the University Farm another state record. —W. D. J.

Too much effort makes men think that your selling task is hard.

## Pascoe Segis Pontiac

HER SIRE: King Segis Pontiac Jannek, who is by King Segis Pontiac and out of a 29.71 pound four year old daughter of Korndyke Queen De Kol's Prince, and she is dam of the sire of the 40.13 pound cow Albina Josie.

HER DAM: Forest View Wayne Korndyke, a 27.96 pound three year old granddaughter of King Segis Pontiac and De Kol 2nd's Butter Boy 3d.

SHE IS BRED TO: King Korndyke Pontiac 20th, the \$6500 son of Miss Valley Mead De Kol Walker.

We ought not to sell this heifer, but we yielded to the request to offer some of the very best heifers in our herd, the others being

TWO VERY CHOICE DAUGHTERS OF PRINCE JULIANA DE KOL WALKER, both of them bred to King Sadie Vale Rose, whose three nearest dams average 33.82 pounds butter in seven days, and he is a son of King Korndyke Sadie Vale. Both of these heifers are out of well bred A. R. O. dams.

A DAUGHTER OF KING KORNDYKE SADIE VALE 22ND, who is a 30 pound son of King Korndyke Sadie Vale, and a double grandson of King Segis De Kol Korndyke. This heifer is just now of breeding age and will be sold open.

We like the idea of offering only high class cattle in public sales, which solely is responsible for our decision to part with these good heifers.

### FARM LANDS FOR SALE

400 acres, stock and grain ranch 3½ miles Pleasant Valley R. R. station, Mariposa County, California. 100 acres cleared and tillable, nearly all could be farmed if cleared of the large oak and other trees. 3 and 6 room house. Large barn and out buildings. Blacksmith shop and tools. Fenced and cross fenced part hog tight. Family orchard and garden irrigated from springs. Average rainfall 29.88 inches. Grapes, olives, almonds, etc. grow without irrigation, feed in pastures and free outside range adjoining knee high. No alkalal or hard pan. Elevation 1500. Half mile to school and church, \$30 per acre, including 300 goats, 3 cattle, 3 horses, turkeys, and chickens and all farm implements. \$3000.00 cash, balance long time, 7 per cent. Fred B. Palmer, owner, Coulterville, California.

**New Openings**—State well located, offered first time regardless present value—town lots, acreage, some improved. Your patriotic duty this year to buy state land, to be sold for taxes. Get the money in the treasury, the land on assessment roll, and crops growing on land. Get bargain at one-tenth value. Because of drink, death, leaving country, etc.; years ago this property went to the state. Because of war, work and worry, most persons will pass these bargains to you. Put in your order now for new 1918 lists and particulars, any three counties, \$5.00. Any man or woman can buy on payments without residence. New law makes all safe. You get mineral and oil rights. Get busy or get left. Joseph Clark, Sacramento.

### HELP

We still need a few more settlers to finish our 6000 acres, which is being sold in 40 acre farms at \$25.00 per acre. Ten yearly payments at 6 per cent interest. ### CATTLE

**Auction of a Complete Dairy**—75 grade Holsteins and 20 grade Jerseys. Herd in cow testing association for 3 years, records announced at sale; tuberculin tested regularly for the past 7 years, last test February 1, 1918, by a deputy state veterinarian, no reactors. Sold subject to tuberculin retest by the buyer. Holsteins mostly first, second and third calf granddaughters of King Segis Pontiac Emperor and Lorena Korndyke, both grand champion bulls at California State Fair. Jerseys bought as calves from the noted Mitchell herd that has been tested for butter fat regularly for ten years. All heifers in sale out of dams that made over 300 pounds butter fat in one year. The herd has been reduced half during the past year, retaining only the cows that made over 300 pounds butter fat in one year. Only two cows with blemished udders in the herd. Cattle loaded on cars free of charge. Will also sell one ton Remington ice machine; brine tanks; pump; dairy equipment, including cans and jackets for shipping inspected milk; bottling machine; bottles, etc.; one fine saddle horse, weight 1200 pounds, and he is a beauty; six Percheron colts, growthy fellows with bone and substance. Owner donated heifer to be sold for benefit of Red Cross and Red Cross lunch will be served. Terms of sale \$100 and under, cash in hand; sums over \$100, six months time with bankable note at 7 per cent; a discount of 3 per cent for cash on sums over \$100 will be given. Sale will be held on Wm. Watt Ranch, 2½ miles northeast of Napa, California at junction of Napa Soda and Berryessa Roads, beginning promptly at 10 o'clock A. M., Saturday, June 15, 1918. Owner, Wm. Watt, Napa; auctioneer, Col. Cy. N. Clark, Modesto; sales manager, C. L. Hughes, Sacramento.

### AUCTION

**On Tuesday, June 4**, we will sell at public auction, 40 head of choice Holstein cows and heifers, giving milk and coming fresh soon. There are also hogs, and a few milch goats. This stock all A-1 and is being sold on account of sickness. The sale will be held at the McCullen Dairy, corner of Indiana and Van Buren streets, Riverside, California half mile south of Arlington. There will be a free lunch at 11:30 and the sale will commence at 12:30 P. M. W. C. Lookingbill, auctioneer.

Big profit selling for us. 30 days trial Money back guarantee. Styles to fit any automobile. Air-Friction Carburetor Company, 213 Madison Street, Dayton, Ohio.

## Ship Better Eggs

FOR years the department of agriculture has been waging war on waste of all kinds, giving particular attention to the great losses in shipped eggs. The Cultivator has passed along these suggestions, and we doubt not the campaign has resulted in material saving to the country. It is probably true that the Pacific Coast needs these lessons less than egg shipping sections farther East. In fact, we may say certainly there is less need here, for statistics show that the losses in the large market centers of the Coast and Mountain states show lower percentage of loss than in New York and other Eastern centers.

But, added to the difficulties of ordinary times, stress of war is making necessary greater care. Regardless of greater economy, every bit of the food which is so greatly needed must be conserved. In addition to the campaign now being conducted by experts of the department of agriculture, state institutions, farm agents and others are taking up the fight. Joining these are transportation companies. The report given to us by the travelling inspector of one of the companies of the country shows that on account of the increased cost of all kinds of packing material and the difficulty in some instances of securing proper containers, many shippers of eggs have been using orange, lemon, shoe and miscellaneous boxes

which were not intended for the transportation of eggs. Transportation companies will in the future refuse to accept shipments of eggs in any other containers than egg cases.

Shippers of eggs should see to it that egg cases are substantially nailed and that a cushion of excelsior, straw or corrugated cardboard is placed in the bottom of all cases and a similar cushion of excelsior, straw or corrugated cardboard on the top, and you should also see to it that all fillers are substantially new and fit snugly into compartments in order to prevent shifting.

All second-hand light or so-called Eastern cases must be roped or wired on each end, otherwise the transportation company will refuse to accept them for shipment. See that all old marks are effaced and that each case is marked plainly and substantially with shipper's name and address and consignee's name and destination.

The department of agriculture has issued three bulletins which will be of value to every egg handler: bureau of animal industry Bulletin 160, "Care of the Farm Egg," an illustrated 56 page bulletin (write for it to Superintendent of Documents, Government Printing Office, Washington, D. C., 15 cents). Others which will be sent without charge are: Bureau of animal industry Circular 140, "Egg Trade of the United States;" Farmers Bulletin 594, "Shipping Eggs by Parcel Post."

## Prevent Egg Losses

The proper handling of eggs is not a one-man job. Many people are concerned in it. Their interests are common, and mutual understanding and cooperation between them benefit all alike.

The producer's part in the general scheme of good marketing is to bring good eggs to market. To accomplish this he should market his eggs frequently; not let them accumulate.

The dealer's job is to keep the eggs good. His slogan should be "Ship promptly and properly." The sooner an egg is put under refrigeration and started for the market the better its quality when it reaches its final destination, and the higher its value.

A stale egg pleases no one. Heat is the egg's enemy; cold is its friend. Precooling eggs before shipping them, therefore, saves food material. It checks the development of "blood-rings," which occur in fertile eggs subject to incubating temperature (63 degrees or higher). It prevents "ad-dled" eggs; the term applied to eggs when the membrane between the yolk

and the white breaks, allowing the two to become mixed. When the eggs are warm this delicate membrane becomes soft, in which condition it is more liable to break by jars which are unavoidable in transportation. Chilling makes the eggs stiff and jellylike, and cold eggs ride best. Precooling retards evaporation, the cause of shrunken eggs. Eggs just laid are full, but 65 per cent of their contents is water. As this water evaporates the quality of the eggs is reduced. Warm temperatures aid evaporation. Precooling helps to make a uniform product, and this is a day of standardization. A weak spot in the egg is the lack of uniformity or standardization for its product. If each case of eggs received at the market is exactly like the last one, the shipper could establish a reputation for uniformity.

Eggs to be shipped should be well packed in clean, standard egg cases. They should be kept under refrigeration and sent to market in properly iced refrigerator cars which retain their good quality. Refrigeration during transit maintains quality, weight, fresh appearance and food value. It retards loss of quality, shrinkage, "blood-rings" and loss of food value.

## EXPERIMENT WITH TURKEYS

That proper care and scientific feeding are more important factors than available range space in the successful raising of turkeys is shown in the results of an experiment carried out by the poultry division at the University Farm at Davis.

One lot of turkeys was hatched last year in incubators and was raised in brooders. They were confined in yards at all times and were never allowed access to free range. Of the original 105 birds, 83 were raised to maturity. This represents 79 per cent and is a high average. The males at seven months of age weighed 17 pounds 12 ounces. The results of the test show that it is not essential in the production of turkeys to have a large amount of range available for the birds.

Consul Winslow at Auckland reports:

As a fair illustration of the rabbit pest in certain portions of New Zealand, and especially in the drier sections of the South Island, it is stated that on an estate lately taken over by the New Zealand government, comprising 12,446 acres of freehold and a pastoral run of 19,250 acres, there were killed or captured about 120,000 rabbits in order to clear up the property so as to make it suitable for the location of returned soldiers.

## HONOR THE BOYS

Written for California Cultivator  
By Ida May Blake

Come let us honor our soldier-men,  
The boys of "sixty-two,"  
The boys who fought for the freedom then  
Of our own Red, White and Blue.

Let us honor the colors they loved so  
well,

That stand for freedom now.  
Let Liberty ring from every bell,  
Again your loyalty vow.

Let us honor our boys who are fighting  
now,  
Fighting to free our brothers  
From oppression and hate that holdeth  
sway,  
Binding them down to others.

Send up a cheer for the "Liberty boys"  
In camp and across the sea.  
Let us share their sorrows, increase  
their joys,  
And keep "Old Glory" free.

## THE MAKER OF BANDAGES

By Maximilian Foster of the  
Vigilantes

DIAMOND is not the hardest thing in the world. A diamond will cut glass and bore through case hardened, tempered chrome steel, but glass and steel—the diamond itself, too — are soft compared to some things. The hardest thing in the world is a hard woman.

Mrs. Britt was such a woman.

I have seen hard women in my time, but never one who was harder. She smiled seldom, and when she smiled it was like the glitter of ice. She spoke infrequently, and when she spoke her speech was like the tinkle of hail on slate roofing. She did not look as if she had ever wept in her life.

Every morning Mrs. Britt appeared at the Red Cross auxiliary in upper Broadway. She was the first to arrive in the morning, the last to leave at night. No one knew much about her though. She was not the sort that make confidences. But that she was a worker—a hard worker—no one would dispute. Efficiency, as you'd suppose, was a trait of Mrs. Britt's.

Efficiency—dreadful word that! How often hard women are efficient! How often efficient women are hard! She was both, Mrs. Britt. The moment she came in at the door she had her hat and jacket off. The next instant she was at her place, her mouth set, grim, austere and hard—hard at work. Probably she did her work only from a sense of duty. Hard women always profess that trait. Duty, duty! But, then, few women are as hard as Mrs. Britt.

In contrast to her was Mrs. Farlow. She was soft and womanly and gentle—the exact opposite. She was not very efficient, of course, though she tried. Day after day Mrs. Farlow sat at the work table, her mouth quivering, smiling wistfully, the tears starting in her eyes. The bandages that came from her were often soiled and rumpled, poorly sewn, too, by her poor little trembling fingers. It was a wonder she could even see to sew at all. Again and again what she turned in had to be thrown away.

But no one reprimanded her. No one even let fall a hint that she was more of a burden than a help. The hearts of all those women ached with womanly pity for the poor, stricken mother. Once in awhile, though, in her corner at the back of the room Mrs. Britt would turn around and throw a glance at her. The glance was as hard as rocks—harder, in fact.

Mrs. Farlow had a son in the Rainbow division. The son was the oldest of her four children, and until he went away the little mother had been the happiest woman in the world. Now any day he might be ordered off to France.

His picture was in the locket she wore. Every half hour she would stop her work to look at it. Sometimes, her face wistful, she would show it to the other workers, voicing the anguish that with every waking breath she drew twanged hollowly in her mother's heart.

One afternoon Mrs. Farlow's oldest daughter came hurrying in. Her face was white. She had just learned that the Rainbow division had been ordered overseas.

Mrs. Farlow rose, her face tragic. One glance she gave about her, then she collapsed, sinking to the floor. In

her fall she overturned a huge pile of antiseptic gauze just torn into squares for Triangulars No. 13.

The room instantly was in confusion. Instantly every one sprang to the mother's aid—that is, every one but Mrs. Britt. She rose and rescued the bandages under foot. Then, her face hard as nails, grimly Mrs. Britt went back to her work. When Mrs. Farlow, still stricken, was led away to her car outside the drab figure in the corner was plugging away as mechanically and methodically as ever. The one glance she threw over her shoulder at the weeping woman was almost contemptuous.

A hard woman, Mrs. Britt; a heartless one, too, it was agreed.

For days nothing was seen at the auxiliary of Mrs. Farlow. It was understood that in her grief and apprehension she was ill in bed. Then one afternoon, pallid and quivering, she came in at the door. She smiled wistfully when the others gathered about her. "Let me work," she appealed plaintively. "Work may help me not to think."

She took a bandage and tried to sew. She made poor work of it, however. Then her head sank on her breast and the bandage slipped from her hands. "I can't—oh, I can't!" she wept.

Once more she was led away.

The same thing happened three or four days later. A week later the mother wandered in again. By now the first of the troops were in the trenches, and her pale, transparent face was like a wraith's. She took a bandage; she tried to sew, and for a third time Mrs. Farlow gave in.

"Oh, my boy, my boy!" she wailed.

The next instant a face was thrust into hers. The face was Mrs. Britt's, and the hard, bony visage was quivering with ill-concealed anger and contempt.

"Sit down! Stop it!" said Mrs. Britt. With one hand she thrust Mrs. Farlow back on her chair; with the other she thrust at her the half finished bandage. Her tone as grim as her face, she spoke, and again the sound of it was like hail pattering on slate. "You're not thinking of your son," she said. "You're just thinking of yourself!"

There was a murmur of remonstrance. Mrs. Britt heard it, and she flashed a look about her. But when she spoke again it was to Mrs. Farlow she spoke.

"You're not the only mother in this war," she said. "If you thought a little more about them and a little less about yourself you'd be doing something. You'd be helping your son, for one thing!"

"Why, what do you mean?" gasped Mrs. Farlow.

Mrs. Britt smiled another adamant, icy smile.

"Your son wouldn't die for want of care. Any one of those bandages I've seen you ruin might save his life. Any one of them might save the life of some other mother's son!"

Mrs. Farlow shrank as if she had been struck. She'd never thought of it that way before.

The silence, the grim reserve, which had cloaked Mrs. Britt seemed for a moment to quit her. "I have no son," she said, her flinty voice biting out the words. "I had one, but he died at Guantanamo. It was in the Spanish war," snapped Mrs. Britt, "and there were no bandages—nothing. That's why he died. That's why I'm here now. It's to keep other women—mothers—from becoming the sort of woman I am." A harsh, brittle laugh escaped her. "Oh, I know what you think of me. I've heard what you said. Well," said Mrs. Britt, "my son wouldn't have died like that maybe if I hadn't sat around sniffing and snuffing, never doing a thing."

Then, her lips drawn into a bony smile, she glanced about her once more and stalked back to her place in the corner.

That night Mrs. Farlow rose from her place at the bandage table and sought the table at the back. For the first time that day Mrs. Farlow had managed to create half a dozen bandages, none of which had to be thrown away. Timidly she held out a hand to the drab, dingy figure in the corner.

## The Cultivator Patterns

8539—Girls' One Piece Dress. Cut in sizes 6, 8, 10, 12 and 14 years. A large collar of contrasting material finishes the neck.

8527—Ladies' Slip on Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The front shoulder edges are gathered to the back which extends over like a tiny yoke.

8537—Ladies' One Piece Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron may be fastened at the back with one button or with two tapes.

8147—Girls' Dress. Cut in sizes 6, 8, 10 and 12 years. The lower section of the waist is gathered to the yoke and the skirt is in one piece.

8805—Misses' or Small Women's Dress. Cut in sizes 16, 18 and 20 years. The waist fastens at the back and the front is all in one piece; the skirt is a one piece model.

8798—Girls' Long Waisted Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress is slightly long-waisted, and it has a long, graceful surplice closing.

8778—Ladies' Yoke Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The lower section of the skirt is all in one piece with straight lower edge, and it is gathered to a fitted yoke.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT  
California Cultivator  
Los Angeles

"I—I've done better today," she said timidly.

Mrs. Britt looked up at her. Out of the corner of one glassy eye something welled, then fell, running slowly down her cheek.

"He was only 20. He was all I had," said Mrs. Britt.

### Hominy Muffins

One cup soft boiled hominy, one teaspoon salt, one and one-half tablespoons shortening, one egg, three-fourths cup milk, two cups corn flour, four teaspoons baking powder.

Mix together hominy, salt, melted shortening, beaten egg and milk. Add flour which has been sifted with baking powder. Beat well and bake in greased muffin tins in hot oven 25 to 30 minutes.

### Eggless, Milkless, Butterless Cake

One cup brown sugar, one and one-fourth cups water, one cup seeded raisins, two ounces citron, cut fine, one and one-third cups shortening, one-half teaspoon salt, one teaspoon nutmeg, one teaspoon cinnamon, one cup corn flour, one cup rye flour, five teaspoons baking powder.

Boil sugar, water, fruit, shortening, salt and spices together in sauce pan three minutes. When cool add flour and baking powder which have been sifted together. Mix well; bake in loaf pan in moderate oven about 45 minutes.

### HOUSEHOLD-QUERIES

#### Canning Chili Peppers

How can chili pepper be put up, like the kind you buy in small tins, not pickled?—Subscriber.

Be sure to select fresh green peppers. Cut off stem end and remove seeds. Parboil for 15 minutes or until peppers are tender. They should not be cooked long enough to cause them to lose their shape. Pack in jars; pour cold water over them to overflowing and seal. They are ready for use any time during the winter.

Or the peppers may be packed raw, after preparing as for cooking, in glass jars, salt added at the rate of a level teaspoon to a quart jar. ((It will be found more practical, however to use small jars, pint or half pint, as they do not keep well after being opened and one seldom has need for a quart of prepared chile at one time.) Place rubbers on jars and tops loosely screwed. Put on false bottom in boiler. Pour a few inches of hot water around jars and heat till steam comes from under cover of boiler. Continue at this temperature one hour. Remove jars and tighten covers. 'Cool' in inverted position to determine if sealing is perfect.

#### Recipes to Exchange

Although a resident of Idaho we receive your valuable paper and I am much interested in the recipes. Please publish some honey recipes, also some canning recipes for fireless cookers, especially vegetables. Here is one of my own cheap cakes but very good:

'Cream three tablespoons sugar with two and one-half tablespoons fat; add one cup molasses, two cups flour (can substitute one cup barley, one wheat flour), yolk one egg, one teaspoon soda, cinnamon, cloves, lastly one cup hot water. Bake in three layers. Any kind of filling may be used and a raisin filling is especially good.—Mrs. B. B. McCament, Jerome, Idaho.

The Cultivator will be glad to publish recipes for canning with fireless cooker and for using honey in response to Mrs. McCaments' request. For all published a three months extension of subscription will be credited to sender.

Rose Potpourri

Please give directions for making

potpourri for rose jar. — Subscriber, Los Angeles.

Gather petals of the most fragrant roses. Spread thinly over sheets or papers and dry for several days, turning occasionally to make sure that all are evenly dried to a crisp state. Old formulas tell us to dry them in the sun, but I have found it better to dry in the house where the petals dry more slowly and evenly and where there is no wind to blow them off the drying sheets. Perhaps our California sun is hotter — we know our air is dryer — than in the Eastern states or in England whence hail our grandmother's potpourri recipes.

Other sweet scented leaves and herbs may be added. Thoroughly mix with the dried petals the following potpourri spice and place in rose jar:

Spice for potpourri. Ground cinnamon, one teaspoon; cloves, one teaspoon; attar of roses, three drops; glycerine, nine drops; pure alcohol, one tablespoon; oil of lavender, six drops; rosemary, six drops; powdered orris root, two ounces. These dry ingredients should be sifted together and bottled with the glycerine and alcohol until ready to use.

In addition here are two other formulas:

Dry rose leaves in the sun, turning constantly so that all may get crisp and dry. Add sweet scented geranium, lemon verbena, honeysuckle, lavender, etc., all of which must be thoroughly dried. After about two weeks' drying pepper the leaves with powdered orris root, cinnamon and salt; about a tablespoon of each will be required to the quantity of dried petals necessary to fill an ordinary sized rose jar. Then add 20 drops each of oil of cloves and lavender, half that quantity of oil of cinnamon and as much oil of musk as you feel entitled to spend on your rose jar. This is the most expensive item in the preparation. Mix all together and place in a wide-mouthed jar. For the first year or two the leaves should be stirred constantly. Keep your jar in a dry place and each season you will be more delighted with its fragrance.

Three handfuls orange flowers, three of clove jilly flowers, three of damask rose leaves, one of marjoram, one of rosemary, one of myrtle, one of lavender, half handful of mint, rind of one lemon, six bay leaves, quarter ounce cloves. Chop finely all together and thoroughly mix. Spread in layers in jar with handful of bay salt between each two layers.

### "STUDY TO BE QUIET"

We are all willing to admit that there is no wisdom beyond omniscience, yet it is a strange fact that few of us are wise enough to trust the Supreme Intelligence in a crisis, but go fussing and fretting about as if the fate of the universe depended entirely upon our own decisions and actions. This is no argument for that negative philosophy that would have us sit still and do nothing. It is good to work, it is right to think and to try to think in terms of clarity and order, but after one has done his little best it is a safe plan to leave the rest with the Creator. For we are all only actors in the great drama of life while God is still the director in chief. "Take no thought for the things of tomorrow," said the great Teacher, and nearly 2000 years later the beloved Lincoln said, "Say your prayers and go to sleep."—L. A. Times.

"All the resources of the country are hereby pledged"—now is the time to work them to the limit.

## IRONCLAD KHAKI

(Twill Cloth)

Uncle Sam's Boys and Girls Both Wear Garments of

### IRONCLAD KHAKI

the patriotic economy cloth. It's fast color — can't fade and wears like leather.

Be sure the Ironclad "army" label is sewed in every khaki work shirt, pants and overalls you buy.

## FRENCHGLOSS

Is a Finishing Article for Home Use

It is used either with Starch or by itself for soft finish garments.

Its use gives all garments a smooth, pliable, lustrous wearing finish, that will keep fresh and clean from one-third to one-half longer than garments laundered without it.

You will find your ironing much easier and more satisfactory in every way when using FRENCHGLOSS. When used for starched garments you can save three-fourths of the amount of starch ordinarily used, besides having better looking clothes.

You will also find that when garments have once been laundered with FRENCHGLOSS they wash much easier. The reason for this is that FRENCHGLOSS keeps dirt from working into the garments. If you boil your clothes, try dropping a couple of FRENCHGLOSS tablets in the boiler. It will surprise you the good it does.

FRENCHGLOSS is sold on a money-back offer: if not pleased with results your grocer will return your money. Price, 10 cents for a package large enough for six large family washings. By mail, if your grocer does not keep it.

FRENCHGLOSS CO.

1157 E. 12th St.

Oakland, Cal.

HAY

Under date of May 25, Scott, Magner & Miller says:

Receipts past week 809 tons. Owing to the general hay trade being so dull these small receipts have been adequate to furnish all demands and the market remains about the same as for several weeks past. A few cars of new alfalfa of very good quality arrived during the week and sold on a basis of about \$18 per ton. This was for good hay, free of foxtail. The cutting of new crop hay is quite general. Some sections show very short growth, while others show a very fair crop. The cool weather of the last week has been most beneficial to all growing crops, both hay and grain, and conditions have improved very much in many sections.

Quite a little acreage that was sown for grain has and is being cut for hay, owing to the lack of moisture in the ground. If the cool weather continues considerable that would otherwise be cut for hay will be allowed to stand for grain. It now looks as though stock hay would be rather abundant and choice hay in light supply.

Trade in the interior is fair, while export demand is very light. It is rumored that the government may set a price on hay in the near future, the same as they have done in wheat, beans, woolen goods and other commodities. In such a case it would have a very important bearing on conditions in the hay trade.

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay  
(light five wire bale) .....27.00@28.00

May 23  
No sale in New York because of Red Cross day.  
May 24  
St. Louis: 1 car. Val. 3.60-5.80.  
May 27  
New York: Market higher. Val. 4.65-8.45, Mikes 5.40-8.15, Seeds. 6.00-6.80, lem. 4.95-7.95.  
Boston: 4 oranges, 2 lem. Val. 5.30-7.55, Grapefruit 1.30-1.95, lem. 7.05-7.25.

THE WAY TO WIN

If you think you are beaten, you are;  
If you think you dare not, you don't.  
If you'd like to win, but you think you can't,  
It's almost a cinch you won't.  
If you think you'll lose, you're lost,  
For out of the world we find  
Success begins with a fellow's will—  
It's all in the state of his mind.

# Labor Saving Bean Threshers FOR EVERY GROWERS NEED

The new Junior No. 1 and 2 are especially built with sacking platform for traveling over the field. An economical seven man outfit for threshing from windrows.

The Junior No. 1 and 2 Ventura Bean Thresher with sacking platform.

To meet the threatened shortage of labor, the New Junior No. 1 and 2 VENTURA BEAN THRESHERS have been developed each with a sacking platform and extra long bagger. Mounted and with portable power and long drop feeder, four horses or a small tractor will pull this light machine between windrows operating with only 7 men. It is sold with or without engine.

The No. 1 is equipped with 26x32 inch cylinders. The No. 2 with 26x38 inch. No. 1 requires a 10 horse power engine, No. 2 requires 12 horse power. Each machine is constructed on the same scientific practical lines as the large machines that we have been building and that have given satisfaction everywhere for the past 22 years. The same high grade material, workmanship and construction goes into each machine and each will thresh EVERY VARIETY OF BEAN, including horse beans.

The Junior No. O, 2 or 3 man Ventura Bean Thresher. Sold mounted or unmounted, with or without power.

This year we offer the Junior No. O, a bean thresher built for the individual bean raiser who has a small acreage. This will thresh ALL VARIETIES of beans. It can be mounted on an ordinary truck, hauled from place to place and operated with small stationary engine or tractor. It is a two cylinder machine, 20-in. by 26-in. Farmers with relatively small acreage will find this machine a most valuable asset. It is built on the same scientific principles as the larger machines and will do thoroughly satisfactory work.

When you buy a VENTURA BEAN THRESHER you are buying the results of 22 years of manufacturing and operating experience that has proven to have turned out the most practical and best Bean Threshers made anywhere. Our threshers are made especially to thresh beans. They are different from any other threshers and are equipped with devices that render special service and that are not to be had on any other models.

All Ventura Bean Threshers, large and small can be equipped with CLIPS ON THE CONCAVE TEETH. These clips were invented by us and with double punched cylinder bars, it is possible to quickly adjust our cylinders and concaves to properly thresh beans IN ANY THRESHABLE CONDITION. No other machine in the World offers this very necessary equipment and it often means the difference between success and failure. From year to year, working and experimenting with hundreds of machines in operation in the heart of the bean district have given us an opportunity of observing and improving of which full advantage has been taken and the result is a series of bean threshers as near perfect in operation as it is possible to make them. Many of our principles in use and our devices are the result of special study to produce something necessary to thresh the different varieties of beans under any and all conditions. Our factory, located at Ventura, assures purchasers that parts and extras are always close at hand which means a great deal in our short bean threshing season with large crews. VENTURA BEAN THRESHERS are made to do a maximum amount of work properly with a minimum of help and power.

Write us for information about BEAN THRESHING MACHINERY telling us your acreage, how many sacks per day you would like to turn out, the kind of beans you have, what horse power engine or tractor power you have, the make of engine or tractor and we will furnish you free, information as to your most economical and satisfactory requirements. We make six sizes from the Junior No. O which can be operated by two or three men, to the Ventura Senior No. 2 which has a record of threshing 3000 sacks per day. Address

## The Ventura Manufacturing and Implement Co. Ventura, California

Lactein saves the baby chicks, increases egg production and makes chickens pay.

# Makes Hens Lay LACTEIN Makes Hogs Pay

When fed to hogs Lactein prevents sickness, increases weight and doubles profits.

## FEED LACTEIN to HOGS and CHICKENS

### WHAT IS LACTEIN?

Lactein is nothing but buttermilk and whey condensed, pasteurized, sterilized and modified. It is produced by separating the water from the solids at a temperature and in a manner that stimulates the Lactic acid and renders the product commercially practical for shipping and feeding. Feeding experiments made during the last few years have demonstrated that buttermilk is of immense value when fed to hogs as a supplement to grain feed.

### BETTER THAN BUTTERMILK

Lactein has been proven to be much better than raw buttermilk because the acidity is not only always the same but having been sterilized or heated to such a degree that all pathogenic bacterial life has been destroyed and the concentration with the special treatment has increased the Lactic acid to a high degree. It is this concentration of the Lactic acid that makes it the most safe, reliable and profitable supplement to grain feed for hogs.

### LACTEIN MAKES HOGS FAT

Lactic acid is the best appetizing agent known. It not only keeps the digestive tract free from putrifying bacteria but it promotes the growth of acid forming bacteria and maintains and regulates normal digestion. There is nothing that compares with Lactic acid in making a grain ration palatable for hogs.

### LACTEIN IS A MUSCLE BUILDER

Lactein on account of its easily assimilable protein and high content of nutritive salts is of great value as a muscle and bone builder and especially for young pigs and brood sows. It creates appetite, increases assimilation and is a splendid conditioner.

### HOW TO FEED LACTEIN

There are no set rules for hog feeding but we all must acknowledge that hogs should have a balanced ration. They must also be fed something they like; for hogs, like individuals, have appetites and know what they like or dislike. There is nothing so good as Lactein

to keep a hog's appetite at the top notch. It may be fed as a slop or drinking water by mixing one part Lactein to thirty parts water, or it may be first mixed as follows: Lactein one part to water ten parts and then added to grain in the ratio of one gallon to ten pounds of grain or it may be fed both ways at the same time. It can be used with any feed where you would use raw buttermilk and in the same way when the water has been added, as we only remove the water and you get the full feed and tonic value of the buttermilk with the added advantage of this product being thoroughly sterilized and pasteurized thereby killing all injurious bacterial growth which is only too common in raw buttermilk.

### LACTEIN INCREASES PROFITS

Lactein is not only a safe feed but considering its high factor in weight production and in adding food value to grain feed is the most valuable and economical feed to be secured.

### LACTEIN PREVENTS DISEASE

Lactein is both a tonic and a laxative. It keeps the hogs strong and healthy and reduces the death rate to a minimum. In fact if pigs are fed on Lactein they will not be subject to cholera or other diseases as the Lactic acid destroys all poisonous bacterial growth in the intestines thereby making disease impossible but nothing will convince you of the value of Lactein like feeding it for a few months to your own hogs—and see them "kink their tails" and "squeal" when they come to feed.—Try it.

### FEED LACTEIN TO CHICKENS

Lactein when fed to chickens is a tonic, appetizer, liver and bowel regulator, body builder and egg-producer. It will retain its acidity and other properties indefinitely and under any climatic condition. Nothing, however, will convince you of the worth of Lactein like feeding it to your own chickens. "The proof of the pudding is in the eating thereof." Any chicken raiser who will feed Lactein as directed will never be without it, for it means more healthy chickens, more rapid growth, more eggs and more money.

## LACTEIN

LACTEIN is put up in wood barrels holding five, twenty-five or fifty-two gallons. Should your local feed dealer not have LACTEIN, write us direct and we will see that you are supplied without delay, or better yet, fill out and mail the coupon below or a copy of it, and we will send you a five-gallon keg by express, prepaid. This when diluted with water as per instructions is sufficient to acquaint you with the wonderful merit of LACTEIN. The price in fifty-two-gallon barrels is \$26.00 per barrel, twenty-five-gallon barrels, \$15.00, and five-gallons \$3.50. Order a barrel from your local feed dealer today and you will never regret it. We guarantee satisfaction.

The largest and most successful chicken and hog raisers all over California feed and recommend LACTEIN, and the results they obtain are really remarkable.

Cut this out and mail today.

LACTEIN FOOD COMPANY,

Hearst Building, San Francisco:

Ship me a five-gallon trial order of LACTEIN by express, prepaid, for which I hand you herewith \$3.50. Send full directions for feeding.

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

California grapefruit has not sold up with California oranges. It may be that it never will, but we believe that when the consuming public gives California grapefruit honest consideration it will be given fairer treatment.

The first grapefruits sent from this state were often filled with seed, were far more bitter than the trade liked, and generally showed the mistakes often made by pioneers in every industry. Today's grapefruit is different, but it will take time to make the consumer know this.

A typical grapefruit branch is shown on the cover of this issue. It is one of our most healthful breakfast foods.

## ROTATE

At the Ventura County farm bureau meeting last Saturday Prof. Gilmore referred to the custom in Scotland where it is understood that in leasing the land the tenant farmer is to grow one crop of clover in every four, and there must also be live stock kept on the place. As a rule in America it is different. Too often our lands are leased here with the only consideration being the regular payment of the rental.

This answers for one generation, but with the possible exception of bean farmers, we do not believe there is any line of farming which will permanently succeed along specialized lines. Even alfalfa lands become "clover sick."

## SERVIA

We stand when the Marsellaise is played or the French flag passes; we honor England for her wonderful work in the war; and at all times applaud wonderful little Belgium for her effort to preserve liberty for the world; but too often we have forgotten the Little America of the Balkans, the one country which has stood in southeastern Europe as the most liberty loving of all those people. Servia stood nobly for the continuation of her liberties and was making a magnificent fight against vastly greater numbers of Huns. She contested every inch she was compelled to yield until stabbed in the back by that other Balkan country, Bulgaria. She is now crushed and has left hardly the semblance of a nation. The Allies must see that Servia is restored and made a barrier to the onrush of the Hun devils to the south and east. It is a duty we owe to the remnant of her people and a duty which civilized nations owe to themselves.

## TARIFF CONFERENCE

Not for tariff revision nor for free trade nor for protection are the tariff conferences called for various Pacific Coast sections next week, but for the purpose of securing a fund of information which will aid this country through its congress to enact laws which shall render justice to all and secure greatest prosperity to the entire country.

This commission appointed by congress is desirous of conferring personally with all who are interested in citrus fruit, olives and olive oil, raisins, figs, nuts and allied industries, the poultry industry, in fact, all producing industries of the Coast. As may be seen in the citrus department of this issue a two-day conference will be held in Los Angeles, June 17 and 18; in the deciduous department, another conference at Fresno, June 20; in the poultry department, another at chamber of commerce rooms, San Francisco, June 25.

We hope the producers of this state will give the members of this commission what they came to California to get, first hand information from the producers.

## TRACTOR SERVICE

It was our pleasure last Saturday to mingle for just a moment with a bunch of tractor enthusiasts. They were gathered on the banks of the Ventura River, five miles inland from San Buenaventura. They were all the owners of one type of machine, the Samson. In other words, it was a Samson picnic. Invariably, the owners of these machines were enthusiastic over the use of farm power in the form of tractors. They had used their machines long enough to appreciate their ability to do and to add strength and length to the arm of the farmer. They had also used them long enough to appreciate the fact that their currying down requires a different stroke from that used on the cayuse. In other words, they had found problems, the solving of which was difficult. So they had accepted the invitation of the service department of the tractor factory and came with their families, not only to picnic, but to learn from those qualified to teach.

Like modern war, modern agriculture presents many problems so entirely different from those of yesterday that the Cultivator has been contemplating for some time the rendering of tractor service through its columns. Such service of necessity

cannot be equal to personal service rendered by factories, but it will be of great value and can be availed of after the tractor is backed into the shed in the evening. To that end we have secured the services of one of the best qualified tractor experts on the Pacific Coast. His name — but that is immaterial at the present for he is modest and insists that while he hopes he may become better acquainted with our readers later, for the time being he will remain without a name.

The way to secure the greatest return from this California Cultivator service is to send in the questions which are raised in tractioneering. A few questions already in hand are answered on Page 698 this issue. Tractor drivers may find these along the same lines as those raised by their own difficulties.

## LAND ARMY

The Women's Land Army has given occasion to several hard headed, practical farmers to smile and to wait in anticipation of opportunity to say; "I told you so." And they will have the opportunity, for there will be failures. There will also be — there have been already — many pronounced successes. The woman farmer is nothing new on the Pacific Coast. Some of our most successfully operated farms are under the entire charge of women, and, in any case, the women of the land are nothing if not patriotic. A year or more ago there started in New York a movement to perfect a force which should be far more than advisory, in fact, an actual working force, in the form of The Women's Land Army. This movement steadily advanced, securing amongst its actual workers girls from Vassar and many other educational institutions. It has now reached the Pacific Coast, and a few weeks ago we saw one unit of approximately a score of determined young women starting for the tomato fields of Elsinore. Word has come back that some of these have been relieved from their work; others have made good, and others have done far better than the ordinary hired man. Recruits are coming from our universities, from our teaching force, from our club women, from the ranks of loyal and thinking women in every field of endeavor. Nor are American women alone in this work; there are tens of thousands of the finest of England's women who have been doing the work of field laborers, driving tractors and reapers, cultivating vegetables and caring for live stock during the bitter years of the war. Their work is now under direct government supervision.

Mrs. Myrtle Shepherd Francis who is at the head of the Southern California division assures us that the women are thoroughly in earnest in aiding in feeding our soldiers and the hungry people of Europe. The organization is making an effort to restrain the over ambitious and hold them in lines of work for which they are fitted. Apricot and other fruit growers and dryers are already finding much assistance in securing help for the coming harvest.

The best of it all is that it indicates a stronger determination in the one aim — Whip the Hun.

## This Week's War Notes

Trustees of the Cincinnati public library have barred all Hearst publications.

The line in northern Italy remains intact excepting occasional advances by the Italians.

A state of war has been declared at

Moscow and, rumors — are rife of a counter revolutionary plot.

An Austrian enemy alien has been arrested at St. Louis charged with starting a million dollar arsenal fire.

The Western Union Telegraph Operatives have been threatening strike which has not as yet been actually declared.

The 143rd regiment of California Field Artillery made a practice run from Camp Kearney to Los Angeles, remaining in that city three days.

Super-submarines have crossed the Atlantic and are known to have sunk at least five and possibly 18 vessels off the Jersey coast. All ports are closed.

The British, French and American navies are in daily expectation of the emergence of the Teuton navy and stand ready to accept any challenge offered by the enemy.

Madrid and near-by districts of Spain report the existence of a strange disease which has caused the death of thousands and has reached the proportions of a plague.

Thousands of prisoners in Finland have been brutally treated and many were murdered by Finnish and German soldiers. It is known that there were 70,000 Social Democrats imprisoned. How many have been slaughtered is not known.

Operatives in Eastern textile mills, to the number of 35,000, have gone on strike. Many of these operatives were engaged on government contracts, and the mills have been forced to close. This is nothing less than treason and at this time probably will be so considered by the government.

Information has been secured regarding transactions of the German commercial societies at a conference held some months ago. German commercial people admit commercial injury to that country has been great: "The greatest and best part of our tonnage is in the enemy's hands; our food and clothing are reduced to the extreme limit."

Major General Wood who has been ordered by the war department to remain on routine duty in this country instead of seeing active service in Europe made appeal direct to Washington, and order has been given that instead of being transferred to San Francisco he will go back to Camp Funston where he will remain in charge of the training camp.

It's been a blue week for the Allies. As this page goes to press on Monday however, the situation in France is far more hopeful. Until today the Hun advance has been almost continuous. The Aisne was crossed, and then the Vesle, and even the banks of the Marne were reached on Saturday. This with a wedge-like salient which gives only about a dozen miles frontage on the Marne. The French are still holding firm at Rheims on one side and at Soissons on the other, and the latest news is that the French have even advanced a three mile front more than a mile into the territory secured by the Huns. It is possible the French may be able to repeat their former performance at the Marne and by flank movement capture vast numbers of Germans. The past week's advance by the Huns has been almost entirely in a direct line towards Paris. The Ypres sector has been almost entirely neglected. American troops are still held by General Foch in the reserve line, excepting in one or two minor engagements. Berlin claim 45,000 prisoners taken in the present drive.

# An Arizona Farmers Field Day

Written for California Cultivator by M. E. Bemis

**O**NE of many commendable things inaugurated by County Agricultural Agent W. A. Barr is the encouragement of the field days. The best attended of any of these so far and one that will probably be longest remembered as having proved of great value was the field meeting at the Salt River Valley experiment farm at Mesa 16 miles west of Phoenix, May 22. Twelve varieties of wheat and several kinds of oats and barley are now just ready for harvest. Several varieties of alfalfa and other crops are now growing on what was a few years ago one of the most badly infested Johnson grass farms in the valley. The growing crops, several speakers and the demonstration of four tractors were the drawing cards that brought out an attendance of several hundred farmers who came from all parts of the country.

May 22 was the day, and like most Arizona days was bright and sunny. Early morning visitors had an opportunity of seeing the work of a Moline tractor pulling a six foot mower in alfalfa, the whole outfit operated by one man, apparently with as much ease as one would handle a mower driven by horses. Corners were turned with little difficulty and on the whole, without having the figures of the cost operation, the outfit should interest I think, the farmer who has a considerable acreage of alfalfa at his time when horse flesh is needed for other purposes and horse feed is high.

An Avery tractor pulled three 12 inch bottoms, plowing eight to ten inches. A Sampson Sieve-grip pulled a double disk and a Titan pulled a double cutaway. All three of these moved along at good speed and unmindful that the weather was somewhat warm. This, together with the work done, which was excellent, appealed to the farmer who is coming more and more to realize that the farmer in these times must farm more with machinery and less with horses and men.

At the lunch hour groups of farmers could be seen discussing over their lunch the merits of the several tractors and comparing the work with other tractors and with horse drawn tools. I think this opportunity for discussion is one of the most valuable features of these meetings as it gives men a chance to exchange experiences and compare notes. Many points are brought out that never would be otherwise. It means dollars now when it takes close calculation to figure out how to get around the high cost of labor, provided one can do it at all.

After lunch the visitors sat down under the shade of the trees in the yard and listened to a talk by Dr. A. E. Vinson, chemist of the state college of agriculture on slick spots and alkali. He advised plowing under a growing crop for the slick spots. This in most cases would be all that would be required to bring the soil into a condition to take water. For alkali, Dr. Vinson said that in most lands where the black alkali was present, the application of gypsum and then flooding to wash the alkali out would usually bring the soil back to a productive state. Some one asked the question, "What will be the cost of reclaiming an acre of alkali land?" Dr. Vinson replied, "The cost will vary ac-

cording to the amount of alkali in the soil, and this will have to be determined by chemical analysis of the soil. I don't suppose," he continued, "that any one would undertake to reclaim by the use of gypsum a large tract of land or as much as a quarter section, as the cost would likely be prohibitive, but if a man had a farm with two acres alongside of the road that had alkali so that nothing would grow, he could afford to reclaim those two acres of land that were an eyesore and would decrease the value of his property, if it cost him a thousand dollars an acre to do it." Gypsum is found in several parts of Arizona so

thoroughly there will not be much Johnson grass that will have much vigor at the end of the season." He advised a cotton crop for the second season. A grain crop in winter and then corn or grain sorghum is a good rotation provided there is not too long an interval between harrowing or cultivating to permit the Johnson grass to get a start.

Following these talks the visitors were invited to walk through the farm and see the growing crops. Dr. Geo. F. Freeman, plant breeder of the agricultural college, went along as guide to explain some of the work which is being done in the way of de-

Looking Over the Grain

This shows two plots of Macaroni wheat. Note the roadway is somewhat higher than the land where the wheat is growing hence the wheat does not appear as tall as it really is.

that the cost should not be excessive.

Prof. H. C. Heard then gave a talk on the extermination of Johnson grass. Prof. Heard has been agronomist of the state college of agriculture for a number of years, and the work of Johnson grass extermination has been under his direction, ably assisted by the farm superintendent, C. J. Wood. This was quite fully covered in the Cultivator last December, and the complete results of the experimental work has been published in bulletin form. Prof. Heard briefly outlined the work and the results accomplished and assured his hearers that Johnson grass could be exterminated and that it could be done and not interfere with any well ordered rotation of crops. He suggested that a good way was to plow in the fall, harrowing in spring repeatedly with a harrow which would cut off plants below the surface. "If this is done," he said, "the plant will become weak by mid-summer, and if the ground is then planted to a crop like corn or one of the grain sorghums and cultivated

veloping new and more productive strains of plants.

A number of different varieties of alfalfa which have been selected from individual plants or bred from crosses carefully made are being grown in rows so that results can be noted. Of the standard varieties of alfalfa, Dr. Freeman recommends the Hairy Peruvian as being best adapted to the Salt River Valley, but cautions any one sowing this to be sure to get true seed of the Hairy Peruvian.

The grains show up wonderfully well now. Twelve varieties of wheat are growing on the farm and seven or eight of these are in small plots of a quarter acre each, the seed of which has been grown from single selected heads. This of course represents several years work, but within a year or two there will be sufficient wheat so that it can be distributed among a number of farmers. Two varieties of Macaroni wheat show up well. This wheat has yielded as high as 67 bushels an acre. One or two other varieties seem to promise some im-

"Gentlemen, Note These Varieties."

Dr. Freeman explaining to the assembled farmers the different varieties of alfalfa which he has bred and is now growing in rows to compare with well established varieties.

provement over Early Baart, which at present is the most popular wheat of the valley.

In growing wheat Dr. Freeman says that we can easily raise 40 bushels of wheat to the acre and that if we will withhold water after the wheat reaches the milk stage we can produce as hard a milling wheat as can be grown in Kansas. Later irrigation he admits will add five bushels of wheat to the acre but at the expense of quality. He insists that millers should offer a premium for the better milling wheats. In his work of breeding wheat and making head selections Dr. Freeman stated that he has discarded more than 500 varieties of wheat that did not come up to his standard.

Oats too are being grown, one variety having yielded at the rate of more than a hundred bushels to the acre. Several varieties of barley, including the famous Wisconsin, are being tried out.

With the interest in cotton that now exists in the Salt River Valley, the experimental work being done with cotton will be watched with interest. Cotton planting began March 5 and has continued at intervals up to May 15. As these plantings are all in the same field the results should indicate the most desirable time for planting. Experiments are also being conducted in the thinning. This is a much debated question among cotton growers, and so to help throw light on the matter cotton is being grown from eight inches to four feet apart, in rows three and one-half feet apart.

It's been a cool spring. There always comes a hot day in June. That hot day in June causes unnumbered millions of little oranges, but a few weeks since blossoming time, to drop. This June drop is dreaded by every citrus grower, yet, as a usual thing, it is only sufficient to give proper thinning to the fruit, but last year was different. There is no absolute cure or preventive of this drop which may be due, not only to the heat, but to a fungus, to the trees being out of condition, shortage of irrigation, or possibly, other factors. But there is one point which has been observed by every observing citrus grower. The orchard in best of health, with trees supplied with plenty of moisture, filled with young growth and with dark green leaves, stands a whole lot better show than the illly cared for orchard. Dr. Coit has thought that green manure crops which keep the ground cooler, or a heavy mulch, which answers the same purpose, is beneficial. All these points are being considered by the citrus growers, and their orchards are being put into condition to withstand the June hot spell in 1918.

June 28 has been named as National War Savings Day. The president has so ordered. It is to be a day of signing the pledge. These pledges are already being sent out; they call for a statement as to the number of war savings stamps "I or members of my family" have purchased. "In addition to those now owned I agree to buy \_\_\_\_\_" with blanks for each month from June to December. And in addition, this: "I further pledge myself to save and economize, to help win the war."

Yes, they are holding the line, but folks back home must bring up the reserves.

# Agricultural News Notes of the Pacific Coast

## Northern California

The Lake Tahoe state road is open. Appointment of a farm adviser for Butte County will soon be made.

There will be a state convention of stock men held at Davis June 27-28.

Farmers of the Sutter basin will plant 40,000 acres to beans this season.

The Nevada County farm bureau is planning the holding of a fair and picnic.

Pear growers of Grass Valley, Nevada County say the outlook for a big crop was never better.

Hayward poultrymen are protesting at high priced feed, and say it's cheaper feed or quit the business.

The Pear Growers' Association is making a campaign for new members in Santa Clara and Alameda Counties.

Placer County has established a farm bureau labor headquarters at Newcastle with F. H. Howell as manager.

An increased acreage has been planted to rice in the Sacramento Valley, about 50 per cent over last year.

The California Producers' Exchange will build three steel grain elevators and a bean cleaning plant on the river front at Knights Landing.

The farm bureau of El Dorado County has taken up mutual fire insurance in connection with farm bureaus in Placer and Nevada Counties.

The wool clip of Tehama County, aggregating nearly a million dollars in value, is being shipped to Boston. The prices range from 45 to 68 cents.

The cannery of the Olive Products Company at Oroville is now working on fava beans, a winter crop which is in great favor with Italians and Greeks.

Butte County farm bureau is contemplating purchase of sluphur in carload lots for distribution among members.

The Tehama County council of defense has asked the board of supervisors to appoint a county fire warden, with an assistant in each precinct of the county.

The state university contemplates making its entire exhibit at the state fair as one university exhibit instead of having it distributed in the various departments.

The project which will bring Lake County water to Yolo County rice fields is being put through on schedule time. Four pumps will be in operation by June 15.

Rice men of Glenn County have petitioned Horticultural Commissioner H. E. Wahlberg to rigidly enforce the law requiring eradication of water grass and other rice weeds.

Sonoma County wool growers are complaining at the order from Washington commandeering all wool. They say the order has caused great hardship and destroyed the wool business on the coast.

Sheridan W. Baker of the Sonoma County Apricot and Prune Growers' Association estimates that the California prune crop this year will total 125,000,000 pounds, and at a price of eight cents to the grower should sell to the consumer in the East at 15 cents per pound, unless profiteering intervenes.

## Central California

Beans are reported coming up in the Las Posas section.

San Joaquin Valley's loss by grain fires last year amounted to \$16,000.

Women have been working in the orchards of Merced County thinning fruit.

Shafter, Kern County, potato growers are cooperating in marketing potatoes.

Twenty-nine carloads of steers were shipped from Oakdale last week by C. M. Ellenwood.

Fresno County chamber of commerce is getting behind the Pine Flat irrigation project.

The Lindsay Gazette reports set of oranges on older trees very light. The younger trees show big crop.

The pea hulling plant at Empire, Stanislaus County, is at the height of its run. Growers are being paid \$45.

The boys pig clubs of Fresno and Madera Counties will hold a big swine show at the Fresno district fair this fall.

The pea crop of the Ripon district has been light this season owing to lack of moisture and to heavy winds and frost.

Bee keepers of Fresno County held a picnic at Herndon Bridge May 25 under the auspices of the Fresno Bee Keepers' Club.

Farm Adviser Washburn of Santa Cruz County has been devoting much attention to the bee industry in the Pajaro Valley.

Selma canneries have closed their spinach pack, having handled a total of 197 carloads. In two weeks more the apricot season opens.

Bean growers of Stanislaus County have been getting together in an effort to organize as part of the California Bean Growers' Association.

The California Associated Raisin Company has contracted to sell the California Packing Company a large tonnage of raisins for the next six years.

There will be local farm bureau meetings during the month as follows: Lockeford, June 10; Linden, 12; Bellota, 13; Escalon, 17; Ripon, 20; Manteca, 21.

A farm center has been organized in Santa Cruz County, taking in the districts of Amesti, Carlton, Carrolton, Railroad, and the north portion of Watsonville.

Tegner, Stanislaus County, was the scene of a hog sale Wednesday May 29. The sale was held under direction of farm bureaus of Stanislaus and Merced Counties.

At a recent meeting of the Corcoran farm center, Kings County, it was decided to ask the board of supervisors to appropriate funds to provide fire fighting apparatus to protect grain fields.

Kern County farm bureau will hold local meetings at Delano June 10, Wasco 12, Rio Bravo 13, Edison-Fairfax 14, Tehachapi 17, Pond 19, Rose-dale 21, Weed Patch 24, Shafter 26, Arvin 28.

Two hundred and seventy acres have been planted to rice in the Riverbank section of Fresno County. This is the largest single acreage in that section but many plantings are now being made.

## Southern California

The new cannery at Elsinore will be ready for apricots July 5.

Swine producers of Imperial County have organized an association.

The new tomato cannery at Huemene will handle peas this winter.

Alfalfa growers of Imperial Valley have formed a marketing association.

The Santa Ana Walnut Association has let contracts for a new packing house.

Orange County's apricot crop is estimated at only about 30 per cent of normal.

The holding of a summer school at the citrus experiment at Riverside is being agitated.

Orange County reports apricots sizing up very rapidly. Cutting and drying will begin July 5.

It is proposed to give instructions in fumigation at the citrus experiment station at Riverside.

The raisin seeding house at El Cajon has been secured for a cannery. It will start on tomatoes.

A plan to stop the use of orchard heaters—during the period of the war—has been launched by Pomona growers.

The tomato acreage at Huemene in Ventura County is larger than ever this year. A cannery has been established.

Eddie Gordon, a graduate of the University of California, has been appointed assistant farm adviser of Riverside County.

The Van Nuys-Owensmouth section of San Fernando Valley will this year harvest 1000 tons of apricots and 10,000 tons of peaches.

The newly organized Orange County farm bureau is planning an auto tour of inspection to the Riverside citrus experiment station.

Bee keepers of Imperial Valley have organized. Twelve thousand colonies have signed up in this organization which will market the output of members.

The Imperial Valley Milk Producers' association on July 1 will take over operation of the Holtville Cooperative Creamery and the Delta Cooperative at Imperial.

The Harvey eating houses have contracted with Indio date growers for ten tons of dates. This sweet fruit is in greater demand than ever since the war shortage of sugar has manifested itself.

Prices for tuna and other fish have been announced by Seafood Commissioner Crandall of the Southern California district. The price for tuna is \$15 per ton in advance of last year's.

Citrus growers are discussing matter of changing orange pack so that instead of the extreme bulge now given to orange boxes they shall be packed flat so as to reduce total weight to the present 72 pound shipping weight.

Cattlemen of Imperial Valley have organized a marketing association and have elected the following officers: President Albert Moore of Imperial; vice president, Harry Jones of Brawley; J. P. Hertel, acting secretary; directors, O. L. James, Meloland; Wm. W. Ward, Brawley; H. P. Jones, Brawley; Fred Gunterman, Calexico; W. W. Cochran, El Centro.

## The Coast and General

Are you a potatrot?

Camp Lewis, Washington, is feeding 125 tons of hay daily.

The Florida Fruit Growers' Exchange held its annual last Tuesday.

Heavy rains seriously damaged much of Florida's early potato crops.

County farm agents of Oregon are beginning a campaign against squirrels.

The Texas peach crop will exceed 1500 carloads. They will be mostly Elbertas.

Yakima, Washington, recently shipped 40 carloads of cows and sheep to points farther north.

Palm Beach and Dade County in Florida have each about 2500 acres planted in castor beans.

Thurston County, Washington, will unite with the government in paving highways near Camp Lewis.

At no time in the past hundred years has the visible supply of wheat been so low as at this time.

A pupil in the public schools at Independence, Oregon, has sold thrift stamps to the value of \$6700.

Exceeding late frosts near the middle of May injured some tender vegetables and late fruits in eastern Washington.

Timely rains in eastern Washington gave winter wheat its needed moisture. It is now heading and is in best of condition.

Kennewick, Washington, is shipping carlots of strawberries. Its output will be in excess of 50,000 crates, or about 60 cars.

E. Powell Lewis of a large canning company at Melbourne, Australia, is investigating canneries and canning conditions in California.

The food administration at Washington reports that cases of bribery between food investigators and food distributors have been discovered and will be punished.

Oregon apple growers are appealed to to continue caring for their orchards. During the last few years many have been discouraged and orchards have been neglected.

Arizona reports weather cool and windy, especially in the southwest portion, so that alfalfa, cotton and cantaloupes, while in excellent condition, are somewhat backward.

New York state has six women farm labor specialists who are encouraging intensive farm labor methods and in suitable sections of the state will locate women's farm labor units.

A further cut in England's meat ration limits the cards to two a week, each entitling to a ten cent purchase. Nor is this the only shortage, and it is possible that a compulsory rationing system may extend to bread, cheese and tea.

Salt River Valley, Arizona, now estimates that she will require 25,000 cotton pickers and handlers to care for the crop this season. Pima cotton which is exclusively grown there is required in large quantity in the manufacture of airplane fabric.

Florida orange and grapefruit growers estimate that it costs 85 cents per box to pick, pack and market through the exchange. The average freight market from Florida to the Northern markets is 75 cents. Icing costs about 15 cents per box; most of the fruit, however, is shipped without icing.

# Some Pointers on June Drop

By Robert W. Hodgson

THE present time prospects are bright for a bumper orange crop next season. Assuming that a bumper crop is desirable, what can the grower do to provide conditions favorable for the setting of this bumper crop is the question which interests citrus growers just now. It is now too late to plant a summer cover crop and expect it to function during the critical period which is nearly half over. June and July will tell the story of what the crop is to be. Growers who do not have summer cover crops stand to suffer losses similar to those of last season if we get weather of the same variety. The fortunate thing is, however, that such remarkable coincidences of extremely high temperature, intensely dry air and hot dry winds as occurred during June of last season are very rare. The only economic method now known of preventing the June drop under conditions of the kind just mentioned is by the use of summer cover crops.

The June drop is largely caused by adverse climatic conditions and obviously then, methods of prevention must be in the nature of means to modify or ameliorate climatic conditions. Our citrus growers have not realized the "eternal fitness of things." We have been trying to grow citrus trees in our semi-desert climatic conditions without regard to whether they are adapted to these conditions or not. The orange is native to the tropics where climatic conditions are much more favorable for growth than they are in California. It is naturally ill adapted to withstanding the extremely dry air, intense solar radiation, and high soil temperatures of our long hot dry growing season. This applies particularly to the Washington Navel orange. Some of the hitherto unexplained difficulties which we have suffered are to be ascribed to this fact. Such are the June drop, splits, puffing, "dry" fruits and others. It is not unlikely that mottled leaf and die-back will ultimately be traced to abnormal unfavorable soil conditions.

One of the most efficient means of modifying climatic conditions is by the use of summer crops which cut down the soil temperatures by shading and also give off large quantities of water vapor into the air, raising the relative humidity about the

trees. In windy sections the use of windbreaks in connection with summer crops aids in preventing the blankets of moist air from being rapidly dissipated. The practice of using summer cover crops in citrus orchards is not a new one; only the application to the June drop phase is new.

the assertion that eight or ten years hence summer cover crops may be looked upon with as much favor as winter cover crops are at present.

But, granted the grower did not get a summer cover crop in, is there anything he can do now to help set the crop? The most important thing he

are irrigated they let go of it. For this reason many growers have been prone to assign the cause of June drop to the irrigating with cold water, or irrigating while the trees are in bloom. The fact is that the trees got dry and the shedding caused by the lack of sufficient water was only noticeable after the trees were irrigated. The ultimate cause of the shedding is the presence of water deficits in the young fruits, that is, they actually decrease in water content. If the trees cannot get sufficient water from the soil these deficits are very easily occasioned. Too much care cannot be taken to keep soil moisture conditions optimum. The experience of last season showed that no matter what soil moisture conditions were the drop occurred. That was due to the combination of extreme climatic conditions which does not occur every year. But where the soil was dry the drop was worse than where the trees had plenty of water. In ordinary seasons much good can be done by keeping the trees adequately supplied with water.

The matter of the proper period between irrigations is becoming more and more involved and only emphasizes the absolute necessity of each grower studying his own soil and irrigating only when the water content is below optimum. Growers must get away as much as possible from irrigation at set periods regardless of soil conditions. Thus investigations on the Limoneira orchard have shown that in the heavy soil characterizing that section, orchardists have been irrigating too often, and better results are now being obtained by less frequent irrigation. Again, work by Jansen has indicated that for certain soils in the Porterville section, irrigation must be done more often than is the present practice as the soil available to the tree roots actually reaches the wilting per cent a week or ten days before the ensuing irrigation. The writer is of the opinion from his knowledge of the citrus sections that many groves, especially on lighter soils, are not irrigated often enough.

Another factor bearing on the quantity of fruit set is the general health and vigor of the trees. Starved or weak sickly trees cannot be expected to set heavy crops. Other things being equal the grower who supplies his trees with a source of quickly available nitrogen during the critical period will have a better crop than he who neglects to feed his trees.

Resistance Increased by Optimum of Water Supply

A healthy tree with soil in best of condition is like a well nourished soldier, ready for the scrap when it comes. Don't over irrigate, but be sure the soil is supplied with sufficient moisture.

A number of growers have occasionally used summer cover crops for green manure purposes. Eight or ten years ago very few citrus growers used winter cover crops and the suggestion of their use was looked upon with disfavor. The writer ventures

can do is to watch his soil moisture conditions and keep the trees well supplied with water. The surest way to cause a heavy drop is to let the trees get dry and then irrigate. As long as the trees are dry they hold on to the fruit, but just as soon as they

## Flat Pack or Bulge

THE new freight rate, or rather the new weight of orange boxes, still calls forth discussion on the part of growers and shippers. Here are two statements, each issued after the Los Angeles meeting at which time it was ruled that the flat pack should be restored.

The first, favoring the present 78 pound bulge box, is by R. W. Irving in charge of traffic regulation at Riverside, in communication through Riverside Press. Mr. Irving says:

"From practical tests already made it has been determined that there is eight per cent more weight of fruit in a box with a full swelled top than in a box packed with a flat top. Basing our calculations on a crop of 50,

000 cars for California, which was produced a year ago and shipped, the railroads would be compelled in the event of a crop of similar size this coming year to produce 4000 additional cars, or in other words, 54,000 cars would have to be provided to do the work that is now being done by 50,000 cars.

"This decision on the part of the growers is all the more remarkable as it does not seem to take into consideration that the only aim and purpose of these United States for some time to come is to win the war. We submit to the lack of wheat bread,—we endure porkless days and other restrictions which the government has seen fit to impose upon us—and we have endeavored by subscription to

the Red Cross and other funds to aid the government in its task—but on the other hand we, as producers, and I personally am one of them, engaged in one particular industry, consciously or unconsciously, calmly by a resolution, attempt by greater demands on labor, by greater demands for material and by greater demands on the carrying facilities of this country, to undo all the work of conservation that has been accomplished since we entered the war.

"A decrease of eight per cent in the net weight of a box of fruit based on a 50,000 car crop will necessitate the production of about 1,600,000 more box shock. To produce this great number of boxes under the present condition of a shortage of labor was

a consideration that should not have been lightly overlooked, and especially in view of the fact that reports have been received of a possible shortage during the coming season of box material itself.

"As to the shortage of labor for packing houses and a limit of eight hours per day being established for the labor of women in packing houses, I need not write as these are difficulties which shippers will have to solve for themselves and even though they did not attempt to do more work in the future for the shipping of the same quality of fruit than they did in the past.

"To those of us on these transportation committees who have been working for months past on the prob-

# Completely Vaporizes Low-Grade Gasoline

## Results Guaranteed

- (1) Wonderfully increased mileage.
- (2) Smoother Running Car at All Speeds.
- (3) Carbon Greatly Reduced.
- (4) Greater Horse-power.

The always-cold Ford intake pipe is not adapted to poor-grade, low-test gasoline of today. It allows your fuel to enter the cylinders only partly vaporized. Only vaporized gasoline can be exploded to produce actual mileage. The rest is unconsumed fuel,—waste—producer of trouble making carbon.

A carburetor only breaks up fuel into very small moist particles. It does not vaporize. Automobile engineers know that heat is absolutely necessary to vaporize the gasoline of today, but the problem has been how to keep it as a vapor until ignited by the spark plugs. If the greatest heat is applied near the carburetor, much of the fuel recondenses to a liquid while passing through the manifold.

The Wilmo delivers the fuel completely vaporized right into the cylinders because the heat is applied in increasing intensity, the least amount at the carburetor and the greatest amount just before the mixture enters the cylinders. There is positively no chance to re-condense to a liquid.

Thousands of WILMO users are getting a mileage increase of over 35 per cent—one of the many direct advantages of the Wilmo Manifold. Write for these testimonials.

You can apply the Wilmo in a few minutes. Once installed, it becomes a permanent part of the engine. No holes to bore. No loose parts. Nothing to watch.

## For Fords and Simple as ABC

The Wilmo Manifold is a simple casting, combining in one piece the exhaust pipe and intake manifold.

- (1) Air and gas pass into mixing chamber in regular way.
- (2) Exhaust from cylinders heats dividing wall (3).
- (3) Hot dividing wall between exhaust and intake chamber of manifold.
- (4) One of intake portholes at which gasoline is superheated and completely vaporized by heat from hot dividing wall (3).

- (5) Outlet to muffler through which exhaust gas passes, free from carbon.

- (6) One of bolt holes, for quick installing.

With a Wilmo you will experience a new riding comfort and a new pocket economy. In a single season it will pay for itself many times over in increased mileage alone. Thousands have proved it.

With a Wilmo your engine will become wonderfully flexible. You will get a quicker, snappier start, especially in cold weather. Every drop of gasoline will do full duty because VAPORIZED.

Order now. If your dealer is not supplied, order direct, giving his name. Having a Wilmo means securing all the mileage that is now doubly yours by right of price and cost of waste.

The Wilmo Manifold for Ford Model T Cars west of the Rockies, sells for \$10.00. With special Imperial Primer so that you can use distillate, the price is \$16.00.

Oakland, California

# WILMO-IZE YOUR FORD

lem of car conservation this resolution on the part of the shippers comes as an absolute blow, and as expressed above, seems to annihilate all the work that we have accomplished in the past.

"While the citrus growers and shippers of California have valuable interests, they should certainly appreciate the fact that their product is not an essential to the winning of the war and they should therefore be only too willing to aid the government in the conservation of cars by paying the increased freight rate per box rather than through lessening the weight throw difficulties in the way."

### Flat Pack

The reasons for the return of the flat as given by one of the packers, A. M. Pratt of the Mutual Orange Distributors, are as follows:

### A. M. Pratt

Time and again, growers as well as the Eastern tourists, and practically everyone that has gone into a packing house for the first time, have expressed their surprise at seeing oranges come up to the press with the last layer almost entirely above the sides of the box. The usual comment is, "You are not going to nail a cover on that box, are you?" But this box slides along to the press, the man jumps on the lever and pulls the oranges down somewhat in the center, but way down in the ends, enough so that the covers which are sprung over the oranges are held in place at the ends, with a big bulge in the center. The visitor and the grower usually say, "Doesn't that hurt the oranges? Doesn't it make them all misshaped? Why on earth do you want to jam the oranges into a box like that?" We have all been trained to smile and explain that the oranges are not hurt very much, that creasing an orange and slightly bruising the top layer isn't so very serious, that we don't like to handle the orange this way, but that we are compelled to on account of competition. The visitor again asks why, and suggests that he is sure that anyone who buys oranges doesn't want to get square, pinched up oranges like that, and we again explain that the good Italian and Greek peddlers take the square, misshaped oranges and manipulate them enough to make them round again before putting them in their pyramids on display; that we wouldn't have to do such things with the oranges if other packers weren't putting up such high packs that we had to do it or else allow ten to 25 per cents per box because of the prejudice of the trade against a flat package.

When you come to analyze the problem, the chief reason that the carload buyer, the wholesaler, and the retailer have requested this high bulged package is due to the natural jealousy and envy of a competitor. Every man is afraid the other buyer will get more weight in a box and a bigger package, and he is mighty jealous about seeing that he gets as big a package and as much weight as the other fellow or he raises a great hue and cry about it.

Several years ago I spent ten days in New York analyzing the packing and selling problem of the Elephant orange, of which house I was then manager. Talking with Westfall, our representative at that time, his first complaint was that the Elephant orange was not packed high enough. I knew that we had gone to the extreme limit in not only squeezing every orange into the box, layer by layer as it was packed, but by putting the last big squeeze on at the press; and

that we couldn't get any more oranges into the box unless we started a marmalade factory. I systematically followed up what happened to the Elephant orange and got to talking with a lot of the little dealers who commended very highly the flavor of the orange and said that no other orange was like it, this being the quality that Redlands can certainly boast of over any other district, but I was surprised and pleased to have a good number of these fruit men suggest, in a courteous way, that our oranges should not be squeezed so much and that they were "too square" and that they didn't want the box so full. These are facts and not imaginations.

The bulged package has gone to a ridiculous extreme where no one gets the benefit. It has done no one any good—it has caused all kinds of breakage in the cars due to the strain on the boxes, and it doubtless has had much to do with the decay. On my trips I have frequently observed that the end oranges and the oranges that were bruised by the press were nearly always the ones that were showing blue mold at the other end. If one or two shippers controlled the peculiar knack of putting up this high pack and using it as a grandstand play for their own benefit, those few shippers would get the benefit, if the rest of the packers put up a flat pack, and providing these few shippers could get the same flat rate and appeal to the trade as giving them something which they could put over on their competitors. But the facts are that when the auction markets showed the high prices that this bulged pack brought to those that first initiated the idea, everybody finally got to doing it and nobody got the benefit, and it has simply been a vicious practice which unintelligent competition has brought about.

### Fundamentally Correct

Fundamentally, a standardized package of anything is correct in an industry. If the seller and the buyer both know that the package has well-defined measurements and weight, it does away with the distrust of the competitor and the playing in an unfair way of one competitor against another by making false claims of differences in measurement, weight or height. The orange business has supposedly had a standardized package, but until this new ruling goes into effect it has never been actually standardized. With shippers using a bulge of from one inch to eight inches at the center of the cover, there was and always will be a wrangling due to "undersized" oranges because a buyer thinks that someone else is going to get a bigger bulge on his box than himself, and he wants to have the bulge on him.

A straight line package, nailed all round to the center, will do away with this wide variation—more than this, with the railroads having advanced their rate to 78 pounds, instead of 72, there would seem naturally a tendency to go to greater extremes than have been practiced, so as to try and get the full benefit of the higher freight rate, and if there was no means of standardizing such a package it would necessarily result that the railroads would again advance their estimated weights and the freight be still higher.

This common sense attitude of standardization is not an effort to take advantage of the trade or to be cunning and give the trade less fruit for the money, or to be "penny wise and pound foolish." The buying trade as a whole will naturally rise in protest at first but I am confident after

the new box has established itself, every buyer will say that the thing was the best for the industry and the trade as a whole. The circular statement we are sending to our agents is as follows:

#### Military Front Soon Necessary

At a meeting in Los Angeles Monday, May 6, shippers representing at least 90 per cent of the citrus industry, after a thorough discussion of the problem voted favorably adopting a positive standardized package of

Reedley, Calif.

known cubical contents by requiring not only the ends but the centers of the tops to orange boxes to be nailed to the box, the cleats to be on top in all instances. This came about as the result of the bulged pack data that the railroads have been gathering proving that the pack averages 78 pounds, whereas the oranges have been taken at an estimated weight of 72 pounds. By the tariff heretofore, technically, the railroads could have required this cubical package, as the description of the measurements of the box does not provide for the bellied top. Instead of doing this, however, they advanced the estimated weight to 78 pounds, thereby increasing the rate per box.

It was felt that a standardized package was fundamentally correct. A buyer would know that his competitors were not getting more oranges in a box than himself. After the trade becomes accustomed to it, it is believed that they will prefer it because of it doing away with the constantly increasing demand made to deliver a bigger and bigger bulged box, and the uncertainty and demoralization resulting from irregular weight and sizes. Breakage should be less, decay should be less and ventilation better in cars. If a smaller dimension box were considered, the automatic box making and nailing machines could hardly be changed to conform to the reduced dimensions; and in box factories it would mean changes that would be necessarily slow in action and getting into common use. It was also felt that if we continued packing the swelled top, that in order to get our money's worth, the bulge would be carried to ridiculous extremes.

The idea will not be adopted until the railroads officially advise when the former rate on the 72 pound basis will become effective on this standardized straight line package. All of our oranges will be the full bulged package until we advise you to the contrary.

#### IMPORTANT FEDERAL CONFERENCE OF CITRUS INTERESTS

THE UNITED STATES tariff commission will hold a conference in the rooms of the Los Angeles Chamber of commerce on June 17 and 18.

The meeting is for the purpose of conferring personally with all who are interested in the citrus fruit and olive industries. A similar conference with those interested in the raisin industry will be held in Fresno on June 20, and with those interested in eggs at the San Francisco Chamber of Commerce, June 25. All of these conferences will begin at 10 a. m.

It is the purpose of the commission to confer, not only with the producers, but with dealers, importers, and in fact all who are identified with the various products. We hope that the meeting will be representative, and that the commission will be able to obtain information that will be of assistance in compiling the tariff information catalog. This catalog will be at the disposal of congress when it again considers tariff legislation.

### Perforated Tree Protectors

Why use anything but a PERFORATED PROTECTOR, which allows free circulation of air and sunshine to gradually harden the tender bark. Practically a small LATH HOUSE ABOUT EACH TREE. Protects from Squirrels—Rabbits—Goats—Hot Sun—Sand Storms—Barking in Cultivation, etc.

We make a number of kinds. TELL US YOUR PEST, and we will tell you what kind to buy. Get our prices. We can save you money.

#### COLLAPSIBLE PLANTING POTS

Why not raise your early Tomatoes, cabbage, chili and egg plant for home use or for market. Do you know that you can start

Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in. THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.

## Prune Prices

Shippers of California fruit have at times fixed minimum price of their product in the endeavor to prevent loss to themselves and, in fact, secure as big return as possible. War times have changed all these conditions, and now the daily press reports:

"For the first time in the history of the prune industry in California growers are to fix a maximum price to themselves.

This action was agreed upon recently at a conference between more than 50 independent growers for the different sections of the state, and representatives of the Prune and Apricot Growers' Association, Inc., with Federal Food Commissioner Ralph P. Merritt. Merritt later will appoint a

commission of nine members, consisting of independent growers of various sections and a delegate who will have full authority to act for the Prune Growers' Association, to determine the base price to the producer.

"The price determined upon must bear the indorsement of the United States food administration for California and will be based solely upon the present cost of production.

"The status of contracts now existing between packers and growers will be determined later by the food administration, it was announced.

"The price to the growers will be fixed within the next 30 days, after crop and labor conditions have been determined more fully, it was announced."

## Labor Situation in Placer County

Placer County's Farm Labor Committee reports: After extended deliberation the committee arranged a schedule of wages in fruit work, considered just and equitable to employers and employees. The figures are intended for work under normal conditions. It is possible there may be rare cases in which the wages should be more or less than here given, but it is very important that the schedule be adhered to just as closely as possible. It should be generally understood that these are the going wages and any changes to be made only by the farm labor committee, which will meet from time to time.

General farm work, 30 cents per hour.

Picking cherries, two cents per pound.

Packing cherries, 15 cents for 12 rows or less.

Packing cherries, 18 cents for over 12 rows.

Packing plums, six cents per box.

Packing peaches, three cents per box.

Packing pears, seven cents per box.

F. H. Howell is county labor agent and has an office at Newcastle. J. W. Barry at the County Exhibit Building, is listing all available help down there.

Employers who furnish sleeping and eating quarters, bath, and other necessary conveniences, can secure all necessary help.

Fifty school teachers from Sacramento want to help us in the fruit harvest after June 7.

## Increase in Production of Potash

THE output of all potash materials produced and marketed in the United States in 1917, as reported by the manufacturers to the United States Geological Survey, Department of the Interior, was 126,577 short tons, which contained 32,366 short tons, or an average of 26.4 per cent, of pure potash. This is more than three times the quantity produced in 1916 and corresponds very closely with the output predicted for 1917 by H. S. Gale, of the United States geological survey, from a review of the mid-year statistics. The approximate average selling price of these potash materials at the points of shipment was \$4.26 a unit—that is, \$4.26 a ton for every one per cent of pure potash in the material marketed. This price corresponds to \$426 a ton of pure potash. The total value of the potash produced in the United States in 1917 was \$13,791,922.

In the following preliminary summary by Mr. Gale the production in 1917 is classified with as much detail as is consistent with the survey's obligation to hold individual reports of production confidential.

#### Output from Brines

The output of one of the four plants producing potash from brines in western Nebraska considerably exceeded that from any other one source or district, and the combined output of these plants represents about 45 per cent of the total for the entire country. Searles Lake, California, was the other source of large production from brines.

#### Potash from Kelp and Alunite

The potash produced from kelp rep-

resents about ten per cent of the total. A large part of this was high grade potassium chloride produced by two companies and the rest was divided among eight other producers, who manufactured kelp char or ash carrying 16 to 36 per cent of potash, used as an ingredient of fertilizer. An unexpected shortage of the kelp crop curtailed the production from this source in 1917.

The production from alunite was not so great as had been expected, though two additional producers from this source entered the field during the year. The plant of the original producer was destroyed by fire in October, and, though the work of reconstructing it has been pushed rapidly, it had not been put into operation by the end of the year. In addition to the high grade potassium sulphate produced from alunite a considerable quantity of calcined alunite carrying 16 per cent of available potash was marketed for incorporation into fertilizers, and raw alunite was shipped to Eastern reduction works to be treated for the recovery of potash.

#### Potash from Sugar Manufacture

A fairly high grade potash produced from the residue of charred molasses at alcohol distilleries, representing nearly nine per cent of the total output, was, like kelp char, used in fertilizer mixtures.

The quantity of potash recovered from the waste liquors produced by the Steffens process of beet sugar manufacture was somewhat augmented in 1917, and many experiments designed to increase the output from this source are being made at beet sugar factories throughout the country.

#### Cement and Blast Furnace Dusts

Eight cement mills reported produc-

tion of potash salts or of potash rich dusts sold as fertilizer during the year, the quantity marketed from this source reaching a total of 13,582 short tons, representing 1621 tons of actual potash. The recovery of potash from cement dusts, which is being rapidly extended, seems to offer large promise for a greater domestic potash industry, and it is expected that the production from this source may take second place in the summary by sources for 1918.

The dust collected from blast furnaces is a significant though still a minor item in the total for 1917. The production of potash from this source may eventually be large, but in view of the stress under which the steel plants are now operating this process may receive but little attention during the war.

#### Ashes Still a Factor

Crude potash is still produced by the old methods of leaching from wood ashes in the hardwood lumber districts, chiefly in Wisconsin and Michigan. Complete statistics of this output are difficult to obtain. Many of the producers keep no exact records of their operations and do not always know the quality of their product, so that exact interpretation of the figures they furnish is impossible. Reports from 36 producers in 1917 show a gross output marketed of 700 short tons, having a value of \$406,856. This is assumed to be about 424 short tons of actual potash.

Refined potash salts were produced from wool washings in 1917 by at least two plants, and some potash was produced from the ash of char obtained by burning other waste organic matter at several industrial establishments.

#### Production One-Seventh Normal Consumption

Potash was produced in 1917 by 82 firms, including 36 wood-ash leachers, most of them operating small works. The total production is about 13 per cent of the normal consumption of potash in the country during the years immediately preceding the war. There is now no crisis as regards the potash supply of the country, though the prices paid for what is obtained are about ten times the normal prices before the war.

All firms have been seriously handicapped by shortage of labor and fuel, difficulties of transportation and inability to get needed equipment. Potash producing plants have been generally included among the industries that are necessary to win the war, and there is a widespread sentiment in favor of assisting, so far as possible, the operations of these plants by giving special consideration to their actual needs. It is exceedingly unlikely, however, that government operation or any direct government financial aid to new enterprises for producing potash will now be considered necessary in view of the successful results obtained from the many privately conducted projects.

#### CROP REPORT

E. S. Kellogg, Horticultural Commissioner, Santa Barbara County

Walnuts will run about 75 to 80 per cent. There has been little blight or aphid injury to date. Peaches have set rather light, about 75 per cent. Apricots are very light, being much heavier in the northern end of the county. We expect about 50 per cent of a crop. Lemons are 100 per cent and better. Apples and pears are showing up good, about 85 per cent.

## The Drying of Tomatoes

By W. V. Cruess and J. R. Zion

VERY convenient way of preserving tomatoes is in the dried state. There are two forms of dried tomatoes, the dried whole fruit and the dried pulp or paste. Both of these products may be dried by solar heat or by artificial driers. The method used will depend on the locality and the amount of sunlight available.

#### Dried Tomatoes

Tomatoes for drying should be firm in texture and not very juicy. Cut the tomatoes in half and spread on trays with the cut surfaces upward. Place the trays of cut tomatoes in a sulfur box and sulfur them for one and one-half hours. A convenient sulfur box can be made by covering a frame with building paper, the frame being large enough to be set down over a stack of trays. An ordinary fruit sulfuring box or house can be used to advantage. The sulfuring is to prevent molding during the drying process and to prevent darkening of the color. Spread the trays in the sun and leave until the tomatoes are leathery in texture, but not brittle;

or the tomatoes may be dried by placing them on the floor of a hop kiln or in an ordinary apple evaporator. The best products are made by artificial evaporation, but very attractive and palatable dried tomatoes can be made by drying in the sun. This, of course, is the cheaper method of drying. Dried tomatoes are subject to attack by insects. If they have been dried in an artificial drier they will contain no insect eggs, but if they have been dried in the sun there is danger of their having been infested with insects. If sun dried they should, after drying, be heated in an oven long enough to kill insect eggs. The tomatoes should then be packed in containers that are insect proof. This may be done by wrapping them in paper and storing them in sacks. Sacks alone are not proof against insects.

#### Tomato Paste

Dip the tomatoes in boiling water for half to one minute to loosen the skins. Peel them and break up into a fine pulp or puree. Special machines are available for this for commercial production or a small household pulp machine may be obtained through

a hardware store. An ordinary food chopper fitted with fine cutting knives will answer the purpose. A better product is made if the seeds are eliminated by passing the pulp through a fine screen. Boil down the pulp until it gets very thick. Frequent or constant stirring will be necessary to prevent scorching. When the tomatoes have been concentrated in this way as far as possible on the stove, the concentrated product should be poured out on trays and left in the sun until it has reached the consistency of thick peanut butter, or it may be dried in an artificial drier in a similar way. The paste may be seasoned during the boiling down process by the addition of suitable spices. Mrs. Jessica Hazzard of Los Angeles recommends the addition of two sliced onions, two buttons of garlic, one bay leaf and two or three chili peppers to each gallon of the tomato pulp before concentration. The Italian method also involves the addition of olive oil and a considerable quantity of salt. If dried sufficiently the paste will keep in jars or cans without sterilization. The yield is about one pound of paste to every ten or twelve pounds of tomatoes. To insure keeping of the paste it may be placed in jars and the jars sterilized for one hour after the water has reached the boiling point. An ordinary wash boiler sterilizer can be used for this purpose.

The paste is excellent for flavoring soups, rice, macaroni, stews, etc.

# Save Sacks and Backs

IN handling your grain crop, don't depend upon expensive sacks. You can do away with this big yearly expense item for all time to come. Make the change now. Handle your grain in bulk with a

## JOHN DEERE

### TUBULAR STEEL ELEVATOR

The saving you can effect in sacks, time and labor, will soon pay for this equipment. The John Deere Elevator is not a temporary means of meeting the present shortage of sacks—it is permanent equipment that will continue to save you money for years to come.

### Ease of Operation—Low Operating Cost—Years of Satisfactory Service Absolutely Assured

**It handles all small grains**—wheat, oats, rye, barley, shelled corn, flax, rice. It has big capacity—it elevates 15 to 20 bushels per minute—handles the biggest load in six to ten minutes time.

It elevates from the wagon into tanks, granaries or cars. It elevates from tanks or storage bins into wagons. Operated by a team of horses or 2½ H. P. gas engine or larger.

The hopper can be folded up out of the way when the load is driven up. Backing the wagon is unnecessary. Hopper is provided with an adjustable feed—you can quickly adapt the capacity of the elevator to the power you apply.

**Built of steel almost entirely**, it will not warp or decay. The elevator proper is made of ½ in. steel well-casing, 6½ in. in diameter. It will never wear out. Portable outfit furnished for large ranches where quick transportation is required.

Because of the many years it will serve you and its extremely low maintenance cost, the John Deere Tubular Pony Elevator is decidedly the most economical elevator to purchase. It is a real solution of your grain handling problem. Buy now, while your dealer is in position to supply your needs. Save money by getting the best—the John Deere. Elevators carried in stock by John Deere Houses at Portland, Spokane, Seattle, Boise and San Francisco.

# GARDNERS UNIT BEAN HARVESTER

**T**HIS Two Unit Size Gardners Bean Harvester cuts four rows, requiring only one man and two horses to operate, cutting your operating cost 60 per cent.

The pointed guide at front separates the vines and prepares them for the knives while the guards above knives gently roll the vines in rows outside the harvester, saving fully 10 per cent of shattered beans.

Knives easily removed for sharpening or replacing.

Prices will be advanced after July 1st, 1918.

Get information from your implement dealer or write for new folder to

**Gardners Harvester Company**  
900 E. 4th St., Santa Ana, Cal.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Turkeys Rheumatic

Some of my turkeys seem to have sore legs, swollen and red about the joints. The skin seems to turn white and the turkeys peck at them and sometimes in walking they lift them up quite high and step as though tied. One of them seems quite dumpy, separates from the flock and doesn't eat, but stands with head down.—R. C. N., San Dimas.

This is rheumatism and is due to dampness somewhere in the environment of the birds. Do they sleep in houses where moisture has collected on the floor or that are so closely shut up that the turkeys breathe and rebreathe the warm, moist air? Perhaps they have been running on wet alfalfa or grass. Young turkeys especially are quite susceptible to moisture underfoot. Roosting out in fog or even rain, such as we have in this climate, ought not to hurt turkeys that are past their infancy, but confinement in damp houses or running in the wet often gives them rheumatism. Painting the legs lightly with tincture of iodine is useful in controlling the inflammation, and the birds should have all the green feed they will eat, but the disease can be cured only by removing the cause. See that they are in a dry, warm, well ventilated coop if they are too young to roost out, and that they do not run on wet ground.—J. A. K.

### "Fuller's Rose Beetle"

Is the "Fuller's Rose Beetle" sometimes called "Florida Dog?"—Subscriber, Chula Vista.

We have never heard of the term "Florida Dog" being used in place of "Fuller's Rose Beetle" (*Armigus fulleri*), and find no reference to it in the entomological books in our library.

### Native Grasses

May I ask you to write me the names of the grasses I enclose, both the common and scientific names if possible. Several of them seem to grow so easily that I have wondered whether they might not be grown for hay instead of barley, more like the Eastern grasses that are sown and cut for hay?—Subscriber, Long Beach.

No. 1, *Phalaris minor*. One of the Canary grasses; No. 2, *Polypogon monspeliensis* (Beard grass); No. 3, *Bromus unioloides*; No. 4, *Bromus villosus*; No. 5, *Bromus hordageus*. The Brome grasses are used in Europe for thickening the grass crops but their food value is low on account of the coarse quality. It may be different here especially in silo so you had better consult the University of California Publications.—A. D.

### Tomatoes Dropping

Why do first crop of blossoms fall off tomato vines? Flowers bloom out full and later stem falls off.—Subscriber, Del Mar.

This fault of tomatoes has been perplexing to many gardeners. It is in part due to the cold weather and will disappear when hot weather comes. Prof. Stanley Rogers in Bulletin No. 239 suggests: "If unfavorable weather conditions cause the blossoms to fall, the time of planting might be changed. Unless the soil is very deficient in nitrogen it is generally better to apply stable manure at least one year before growing tomatoes. Soil which is naturally too rich in nitrogen for the fruit to set well should be avoided.

Do not overirrigate when the blossoms are opening."

### Loquats Dropping

Every year my loquat trees are full of flowers and then they drop off. Do I water them too much or not enough?—Subscriber, Owensmouth.

I do not think irrigation has anything to do with the dropping of the blossoms on your loquats. It may be a case of thrips and I would advise you to have your horticultural commissioner investigate. We know that this insect caused a heavy dropping of bloom in other fruits. If the loquats in your locality are not affected by thrips it might be that this is due to the variety, or that the soil is not suited to them.—J. W. M.

### Sudan—Alfalfa

In the last issue of the Cultivator you state that Sudan hay is not equal to alfalfa. Some few years ago I saw a government analysis comparing Sudan with alfalfa which placed Sudan very little below alfalfa—practically about the same. I was not much interested in Sudan then and the bare comparison is about all that I remember now. I know however, from experience that cattle and horses relish and do well on Sudan hay, consuming most of the rank growth that comes from sparse seeding on rich soil. Sowing more freely would no doubt make better hay. Some say five pounds drilled is enough but I would prefer eight or ten where there is considerable moisture or it can be irrigated.—Subscriber, Arlington.

Without question Sudan is a very valuable addition to our hays or fodders. Henry & Morrison's "Feeds and Feeding" says regarding this close relative of the sorghums: "The hay is equal or even superior to millet and can be fed to all classes of stock without injury" and "in composition it closely resembles timothy and Johnson grass." The same book does not give the analysis of Sudan but it does of timothy, which it says it closely resembles in analysis. The average of various analyses shows water, 11.6; ash 4.9; crude protein, 6.2; fiber, 29.9; nitrogen free extract, 45.0; fat, 2.5. From the same table average analyses of alfalfa show it to contain: water, 8.6; ash, 8.6; crude protein, 14.9; fiber, 28.3; nitrogen free extract, 37.3; fat, 2.3. Bear in mind in saying that Sudan is about the equal of timothy or millet we mean pound for pound. The acreage yield of Sudan is more than double that of either of those crops.

tween domestic and foreign crops: To what extent has there been such a division. Comparison of rates to the Eastern states with ocean freights from foreign sources of supply in 1913, 1914 and 1918.

Panama Canal: Shipments via canal, effect upon transportation costs to the East under normal shipping conditions.

Adaptability of producing areas to other crops.

Prospects for by-product industries.

Export markets: Prospects of increasing exports; restrictions; plant quarantines and inspection requirements of other countries.

The effect, if any, of the activities of the federal and state governments in stimulating industry—such items as standard grades, standard containers, quarantines and inspection, control of insect pests and fungous diseases.

### CONFERENCE ON THE RAISIN INDUSTRY

Outline of information desired at conference in Fresno, June 20:

Present condition of the industry and development since tariff act of October 3, 1913.

Extent to which the American production can supply domestic requirements.

Comparison of competitive foreign with domestic products in price, quality, methods of grading, packing and shipping, demand.

What raisin varieties are imported and to what extent are imported varieties produced in the United States?

War disturbances—effect on production, labor, shipping and markets, essential materials.

What part of the recent increase in production and exports of raisins is due to demands for military and naval establishments of this and other countries? How much of this increase may be considered as other than of a temporary character?

Costs of production and distribution in 1918 as compared with 1913 and 1914: Land values, labor, materials, shipping, marketing and other items of cost, specified. Comparison of costs with those of foreign countries.

Foreign competition: Conditions in the industry in other countries that may affect competition with domestic products; extent to which foreign organizations control prices, production and distribution, and stimulate trade. Description of internal and export taxes in other countries and their effect on the trade.

Freight rates and ocean freights: Comparison of freight rates to the Eastern states with ocean freights from foreign sources of supply in 1913, 1914 and 1918. Panama Canal: Shipments via canal, effect upon transportation costs to the East under normal shipping conditions.

Domestic production: Competition with other states. Chief varieties of table, wine, and raisin grapes and their relative importance. Effect of excise taxes and spread of prohibition upon production of raisins and table grapes, and in the trend towards table, wine, and raisin varieties. Measures taken to develop markets and increase consumption.

Export markets: Prospects of increasing exports; restrictions; plant quarantines and inspection requirements of other countries.

Activities of the federal and state governments—such items as quarantines and inspection, control of insect pests and fungous diseases, standard grades and containers.

Organizations: Name, executive officer, proportion of crop controlled.

## Cleveland Tractors

Buy Now

Save \$105

The price of the Cleveland Tractor now is \$1495, F. O. B., Berkeley—July 1st it will be \$1600. We have purchased 100 Cleveland Tractors, which we can deliver at \$1495, F. O. B., Berkeley. It is a case of first come first served.

We have sold over 200 tractors in Northern California since last fall. A number of large users have given us their second and third orders.

The consumption of fuel is 8½ gallons of distillate and 1½ pints of good grade lubricating oil in nine working hours.

### SPECIFICATIONS IN BRIEF:

Motor: Four-cylinder, 3¼-in. bore by 5½-in. stroke. Protected overhead valves. Horsepower: 12 at drawbar, 20 at belt-pulley. Length: 96 inches. Width: 50 inches. Weight: Less than 3200 pounds. Turning Circle: 12 feet. Track: Length (each side) 50 inches, width 6½ inches. Traction surface: More than 600 square inches. Center to center of tracks: 38 inches. Clearance: 12 inches. Belt Pulley: Diameter 8 inches, face 6 inches. Suspension: Three-point. Heavy duty roller bearings throughout. 1800 pound drawbar pull.

The Cleveland Tractor not only saves time and labor—it does work cheaper and better. It makes possible larger and better crops. It enables you to do your part for the government and make money for yourself.

Does not pack the soil: Works on all kinds of farm land. Pulls a six horse load and moves 50 per cent faster. Operates successfully on 20 to 25 per cent grades.

## Ornamental June Planting Calendar for Northern California

Written for California Cultivator By A. R. Gould

**S**OME may still be late in planting out a few of the late summer flowering subjects, and in that case it is essential to complete the planting out of asters, zinnias, cosmos, etc. It is also time to plan for a late fall or early winter display of sweet peas, and the soil should be well prepared by deep trenching with manure. Various climbers will need attention now such as roses, wistaria, etc.; the long shoots of these should be tied in.

### Bulbs

Where it was found absolutely necessary to dig these up from the beds,

and we refer here to daffodils, hyacinths, tulips, etc., they should be stored in a dark place where they will not dry up too quickly as when they are allowed to shrivel they are very little good for future planting. Where they are being naturalized the plot should be given very little water for a time at least as they require a resting period. However, if they are being grown in a flower bed which is required for growing some deep rooting subject which needs considerable water it will not be practical to leave the bulbs in until the next season, but if a good dressing of rich soil is applied, say six inches thick, a few subjects may be grown for the summer

in the same bed and the bulbs will be the better for being undisturbed.

### Lilliums

The varieties such as *L. auratum*, *L. speciosum album* and *rubrum*, etc., will now need stakes, and a sharp watch must be kept for aphids. Use nicotine solution on these. If you wish to have large blooms you should dig in a little quick acting fertilizer or water with liquid manure weekly. They will reward you for extra care.

### Sweet Peas for Late Fall

If you wish to have some choice blooms in October and November, and lasting through Christmas sow the following in well prepared soil as advised above. Early Snowflake, Early Morning Star, Early Spring Maid, Early Song Bird and Early Melody. These are of the Spencer waved type.

### Stocks for Winter Blooming

Sow the following choice varieties

of nice stocks to secure bloom throughout the winter. Beauty of Nice, Crimson King, Almond Blossom, Nice Purple, Mont Blanc and Monte Carlo. The seed of these should be sown in boxes or on a well prepared seed bed in semi-shade.

### Begonias

The tuberous types of these should be planted out this month in their flowering quarters. They thrive best in soil to which leaf soil has been added. They must be grown in partial shade.

### Dahlias

These will need stakes this month, and if too many "eyes" were left on the tuber before planting they will throw too many shoots and may be reduced to three. They will need plenty of water during the growing season.

### Rhododendrons and Azaleas

These should be well supplied with water as if allowed to become at all dry the new growth which they usually make for future flowering will become stunted. Some of the choice hybrids should still be in flower.

### Hydrangeas

These will now be showing flower and need plenty of water. They will also be improved by liquid manure or a quick acting fertilizer dug in.

### Lilacs, etc.

These and other early flowering shrubs should now be pruned back to encourage fresh growth.

### Violas and Pansies

Feed these with liquid manure or dig in a fertilizer which will help these to carry on and increase the size of the blooms.

## June Vegetable Planting in Northern California

Written for California Cultivator

By A. R. Gould

**T**HIS month we must practice "Weeding and Watering" very thoroughly, and although our planting list is very much shorter this month we can make a few more successional sowings and thus add considerably to the bumper crops which we hope to harvest at the end of the season. Our Allies are looking toward California to supply the urgent need for food supplies and as the season advances we must see that we have done our part. Remember the gospel of food production is quite as important as food conservation and it is up to us who form the land army to strengthen our lines and put forth our greatest efforts. Look your war garden over and see what you can still furnish, and get busy now.

### Seed Saving

This year there is likely to be a scarcity of seed, and it will be a wise plan to collect as much seed as possible from the crops which are producing good types and a few of our earlier sown subjects may be gathered in. We refer to peas, broad beans and radish. Others will produce seed pods no doubt later on and it will be as well to allow a few of the best types to run to seed. Care should be taken to see that seed is only secured from the most vigorous types and that they are absolutely free from disease. Make a selection of a few of the best now and mark them out for seed production.

### Beets

For fall and winter use sow Improved Blood Turnip and Detroit Dark

## The Ball Tread

The weight of the machine rests on the polished steel balls—they roll easily—requiring little power—leaving the most of the energy generated by the engine for hauling the load.

Solid, well-built road-beds, with heavy steel rails, enable the modern railroad engines to haul freight trains of more cars, and heavier loads than ever before.

It's the same with the Ball Tread Tractor gliding on its steel balls—big loads are easy to haul.

Every part of the Yuba is accurately machined, and made from the quality of steel best suited for the hard usage; for plowing deep, turning up new, fresh soil to give greater fertility; for working day and night, in all kinds of weather, in all kinds of soil; for economy in labor and time.

## Yuba Manufacturing Company

Department B

433 California Street

Model 20-35  
Model 40-70

Red. A fairly good supply of water is necessary and frequent cultivation between the rows. Never crowd them in the row. They will need thinning four to six inches apart in the rows to develop fine roots.

There is yet time to make another sowing of that excellent spinach, Sea Kale beet, of great use for table or poultry. The root is of no value but the large broad leaves can be cut again and again.

Beans

Make successional sowing of Kentucky Wonder, Stringless green pod and Golden Wax. You might also sow the Davis White Wax for a good shelled bean for winter use. If you have not sown the small white Tepary yet get some of these in at once; it is gaining in favor every season. Cultivate frequently through the rows of existing crops which should be now making sturdy plants. Keep a lookout for aphids which may be troubling the young tender tips.

Corn

Make a further sowing of Country Gentleman and Golden Bantam. Keep this crop well cultivated. Conservation of moisture is absolutely essential. Where irrigation can be practiced you may still extend your field crop planting.

Turnips

Sow Early Snowball and White Egg as thinly as possible and keep well watered. As the young seedlings develop a dusting of soot will prove beneficial.

Leeks and Celery

The seedlings of these should have been planted ere this in trenches and will now need careful watering and cultivating. Keep a lookout for slugs

Thorough Tilling Saves Moisture

and collect these up at night when they get busy.

Potatoes

These should be thoroughly well cultivated and the soil drawn up in rows toward the plants, thus supporting the plant and protecting the tuber. Watch for any signs of diseased plants, as sometimes a fungus develops and any so attacked should be removed from the row. Where enough water is available on a small plot there is still a chance to plant a main crop variety which will prove useful for late winter use.

Squash, Musk and Watermelons

Supply these with plenty of water and keep the hoe busy. The success of the crop will depend on the start they get now.

Tomatoes

Where the training method is to be adopted, stakes should be given the plants for support and if one single stem only is required all axil shoots must be removed by pinching out, however three main stems may be run up if desired and three bunches of fruit allowed to each stem. Splendid results are however also obtained by allowing the plants to ramble, if good cultivation is given at the start. Black

Handy Tool for War Garden

fly is showing up in some districts and you should spray with Black Leaf 40.

Parsnip

This vegetable is noted for its high food value and will also prove a very fine winter crop to put in storage. Seed may now be sown of Hollow Crown variety in fairly sandy soil in rows 18 inches apart. One quarter of

an ounce will sow a 100 foot row.

Onions

Keep the hoe or cultivator moving throughout this plot and see that they do not suffer through lack of moisture. It will also be helpful if a good dressing of soot or wood ashes is applied.

Carrots

Keep up the supply of these by sowing towards the end of the month Ox-

heart and Danvers Half-long. These are easily stored for winter use and will keep for many months. Sow the seed thinly and do not attempt to grow these on impoverished soil.

Cauliflower

Sow the variety known as Early Snowball for the early crop and to succeed this later grow California Wonder. A small seed bed should be made up in a semi-shaded position and the seeds sown in rows or broadcast in well prepared soil. Begin to get your plot for this crop into shape this month and have it well trenched with manure.

Strawberries

These will need considerable irrigation.

MORE CARE IN HANDLING CANTALOUPE

The United States bureau of markets has just issued a publication, "More Care is Needed in Handling Western Cantaloupes," Market Document 9, containing report of investigations into losses caused by improper handling and directions for securing better results. The summary of the bulletin gives the following points:

The annual production of cantal-

# Here is a Test Special Belt

loupes in New Mexico, Arizona, California, Nevada, and Colorado is approximately 4,000,000 standard crates of 45 melons each.

More than ten per cent of these melons reach the consumer so green that they are practically worthless for food.

To insure desirable eating and keeping quality, western cantaloupes for long distance shipment should be picked just before they reach the full-slip stage of maturity.

The carrying and keeping quality of cantaloupes is directly dependent upon the care exercised in harvesting and preparing them for shipment.

Many weaknesses in present commercial practices can be corrected readily, and serious losses from deterioration or spoilage prevented.

The most careful handling of can-

taloupes is as essential in all operations of distribution to dealers and consumers as in preparing the melon for shipment.

The time which elapses between picking and loading of cantaloupes into iced refrigerator cars determines very largely the amount of overripe and decayed melons delivered at the markets.

After picking, cantaloupes should be loaded as soon as possible into iced refrigerator cars for shipment.

Cantaloupes should not be wrapped. Wrapped cantaloupes do not refrigerate as well in transit nor do they reach consumers in as good condition as do cantaloupes not wrapped.

This bulletin may be secured free by request to United States Department of Agriculture, Bureau of Markets, Washington, D. C.

## Prince Alcartra Korndyke

IS a 40 pound bull, but that doesn't begin to tell the story. His sire is Korndyke De Kol's Prince, whose offspring rank with the offspring of any bull that ever lived in combined production and individuality. His dam is the one and only Tilly Alcartra, the cow that made a 40 pound record as an incident, not as a real objective, for she did it after five straight years of yearly test during which she produced a volume of milk and butter unapproached by any other cow of any age or breed. And today at past nine years of age she is making the greatest record for milk and butter of her whole career. We have only a few sons of Prince Alcartra on hand. We know if you could see them and find how moderately we price them that you would want one to head your herd. Come and see us, or write your wants.

### THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aeromotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

## Tractor Service

ANY of our tractor troubles have been eradicated or at least greatly diminished because the manufacturers have used the lessons of the past year or two in eliminating many weaker parts and making readjustments until there is far less need of tractor service than a year ago. But even with a perfect and standardized tractor there is still need of a service which will make possible greater accomplishment and less loss at a critical time because the tractor has not proved 100 per cent efficient. It must be made more efficient, and tractor schools, books on traction engineering and the technical and farm press are uniting to render this service. Also every tractor selling force has capable demonstrators and instructors. The Cultivator hopes to aid in securing efficiency by this department in which we ask our subscribers to tell their troubles and we will give from qualified mechanics helpful suggestions.

### TRACTOR QUERIES

#### Preventing Fire from Tractor

How may the tractor be cared for, that is, kept free from carbon, or can you give me other hint which will help me to make tractor in harvest field safer?—Subscriber, Los Angeles County.

Your motor can be kept free from carbon by using a good grade of lubricating oil and not using excessively. A little kerosene poured in the top of your cylinders, allowing it to soak over night, will also help to dispose of carbon. A good water jet that is fed automatically, feeding from two to three gallons of water in a 4 1/4 by 5 1/4

engine during a period of ten hours operation will keep your motor entirely free from carbon.

Regarding the successful operating of your tractor in the harvest field, in regard to fire, a good screen over your exhaust pipe, of not too fine a mesh, drawn to a cone taper will keep all carbon deposit from being exhausted into the air, which mostly is the cause of fires. Using a water jet and putting water into your manifold with a mixture of distillate will also be a great help. There are also manifolds now on the market showing covering with a water jacket which will keep chaff and straw from lying against the exhaust manifold, which is also the cause of fire. This can be operated without any danger of fire if a little judgment is used in the operation of your motor.

#### Not Jack of all Trades

Will a tractor take the place of a horse in orcharding or diversified farming?—Subscriber.

Presumably not in all cases. We take it every tractor man will admit that ages of training which have been given to horses and man's long association with them has developed a service which no tractor as built at present can hope to render. A grain farmer can use an ordinary type of tractor, doing all of his work in the grain field with one machine, as they can now plow the ground, disk, harrow, pack it or pull the seeder, also the binder or binders, for which there are special hitches built, or can even handle his header with special attachments. There has not yet been a successful tractor of one type that would displace horses in the cultivation of beets, beans or corn, but there are motor cultivators on the ground which will successfully cultivate any of the above crops, but they are not heavy enough to do the plowing and harrowing.

## A Farm Bureau Meeting.

ONE of the strongest features of rural life is the neighborhood and cooperative spirit which prevails, — or should.

The farmer's first questions when selecting a home are: "What is the soil? Is the water right secure? What can I grow that the market will demand?" But later, and before reaching a definite decision: "Who are the people? What are their likes and dislikes as indicated by churches, schools, clubs? What is their attitude toward movements which call for cooperative effort?" These questions which are asked last are the ones which determine the answer, especially if the farmer be one who has a family, and wishes for that family the best advancement.

War conditions have greatly increased the cooperative spirit in all sections of the country, and in none more than Ventura County which has been filled with people with a desire for the best socially and in every other way. The apricot growers have organized in marketing; the bean growers have pooled their interests; farm-

ers of all kinds have united in cooperative insurance; some of the oldest farmers' clubs in the state are still maintained. Hence the ground was prepared for that latest in cooperative effort, the farm bureau.

Amongst the first in the state to organize its quota, more than one-fifth of the farmers was readily secured, and a farm adviser or county agent was appointed. Later the work was discontinued, but only for a short time. At the beginning of the war period, when conserve and produce more become the slogan, the farm bureau, which had continued its active work even in the absence of its adviser, appealed to county and state authorities for a renewal of the work. Prof. E. O. Essig, who years ago was horticultural commissioner of the county and later secretary of the state horticultural commissioner, from which work he was transferred to the department of entomology at the state university, was appointed farm adviser.

The annual meeting of this bureau was held last Saturday at Foster's Park, a beautiful spot of a few hun-

Farm Bureau Officers and Directors

Ventura County has a live farm bureau. Here is a Cultivator photo of officers and directors elected at the annual at Ventura Saturday. From reader's left they are: James D. Culbertson, Aratus Everett, J. N. Thille, Henry H. Neel, Mrs. Henry H. Neel, W. H. Stiles, Walter R. Sexton, J. N. Frocter, G. N. King, County Farm Adviser E. O. Essig, Prof. J. W. Gilmore, Prof. Walter E. Packard.

Ventura County Farm Bureau

Annual barbecue and picnic held at Foster's Park on the Ventura River, June 1.

dred acres some five miles out of the city of Ventura on the banks of the Ventura River. This was the annual meeting, and after the barbecue and picnic lunch officers as named below were elected for the coming year: President, Henry H. Neel; vice president, L. Mills; director home department, Mrs. Henry H. Neel. The directors at large are: A. Everett, J. W. Hitch, J. N. Procter, Wayne Montgomery, A. C. Hardison, Geo. Hume, E. S. Thatcher, Walter Sexton. Other directors are: W. F. Goodyear, Somis; R. E. Harrington, Simi; Thos. McCormick, Camarillo; Henry H. Neel, Ventura; E. W. Gerry, Mound; J. N. Thille, Santa Paula; Clarence Hawley, Saticoy; G. N. King, Bardsdale; J. M. Horton, Fillmore; Rudolph Beck, Oxnard; Geo. Willett, Wheeler Canyon; A. Everett, Moorpark.

This being the annual and special occasion, Prof. J. W. Gilmore of the University of California was present and told several stories and more truths as to soil conditions, especially as influenced by various field crops. One crop in California, which for many years was grown continuously on the same land, is wheat. This continual cropping reduced production, which in turn reduced acreage until instead of producing around 40,000,000 bushels on 2,800,000 acres as the

state did in 1890, we are producing today only about 5,000,000 on 350,000 acres. Prof. Gilmore maintained that no matter what crop, what soil, nor in what part of the world, the continual one crop method could not be followed without loss of productivity. As "the most successful farmer is the one tied to a cow's tail," so the live stock industry and rotation are necessary to highest success.

Prof. Packard, assistant in agricultural extension, also brought a message from the university. Adviser Essig reported as to the number of visits made and other activities of the adviser's office. The board of supervisors of the county has been appealed to to increase the efficiency of the farm bureau by increasing the appropriation for necessary expense to at least \$6000.

The women's work of the Ventura farm bureau is under the direction of Mrs. Henry Neel who gave an outline of the work expected to be taken up by her department which has just been organized. Crop production in war gardens, land army work, canning and drying, and other activities will be engaged in by Ventura County women.

If there is a farm bureau picnic anywhere in reach every farmer's family should be there. There may be a barbecue.

## Butter Problems in Summer

It is essential to have good milk to begin with. If a centrifugal separator is used it is not difficult to obtain cream of good quality. The cream should be cooled to 50 degrees Fahrenheit before being mixed with the cream from previous milkings. When sufficient cream has been gathered for a churning, it should stand about 12 hours in a temperature of 65 to 75 degrees to ripen. The cream should become thicker and assume a glossy appearance. It should be only mildly sour. Cool to churning temperature 52 to 60 degrees Fahrenheit in summer) and hold for two hours before

churning. Too much care cannot be taken to clean churn and utensils and free them from odors. Stop churning when the butter granules are the size of a wheat kernel and drain off the buttermilk. Then thoroughly wash the butter, using water of about the same temperature as the buttermilk.

If the butter becomes too soft, the wash water may be a few degrees below the churning temperature. Use about three-fourths ounce of salt per pound of butter. Work sufficiently to dissolve the salt and remove the water, but guard against overworking which gives the butter a salty texture.

## History Making Jersey Cattle Sale

A New York breeder pushed the price of Jersey cows up another notch when, after a few moments of spirited bidding, he offered \$10,000 for the Jersey cow Oxford's Briar Flower at Edmond Butler's sale of imported Jerseys at Mount Kisco, New York, May 2. The price leader is a daughter of the bull Oxford Majesty, made famous by achievements of his progeny in the show ring and at the milk pail.

The sale ring was the scene of the wildest excitement and the greatest outburst of enthusiasm that ever prevailed at a Jersey gathering. The sale was held on the day following the fiftieth annual meeting of the American Jersey Cattle Club, on which occasion the officers announced that the club had just ended the greatest year in its history in spite of war conditions.

The greatest price ever paid for a Jersey cow previous to the Butler sale was paid at the time that Lady Viola sold at public auction for \$7000 in 1911. The Butler importations, numbering 95 head of Jerseys, were re-

duced somewhat by the sinking of a ship by which 35 animals were lost. Those arriving on this side brought the greatest average price ever obtained at a public auction. Sixty head were sold for \$60,115, an average of over \$1000 per head. There were 19 animals sold at more than \$1000 per head.

### MORE CATTLE GRAZING

On the Trinity National Forest 14,000 head of cattle are grazing this season. This is an increase of 1000 head over the allotment of last season.

### TRUE WILL JUDGE IN HONOLULU

Prof. True of the University Farm at Davis has accepted an invitation to judge livestock at the First Territorial Fair to be held at Honolulu, June 10-15.

A Tehama County rancher has been arrested, charged with selling tubercular stock.

72 page catalog  
mailed upon request

## Waste Nothing

This is no time for "cream slacker" separators or wasteful methods of skimming milk.

With butter-fat at present prices and the Food Administration begging every one to stop waste, "cream slacker" methods of skimming milk must go.

Whether you are trying to get along without any cream separator or using an inferior or partly worn-out machine, you are wasting butter-fat and losing money.

## Get a De Laval and save ALL your cream

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

## THE DE LAVAL SEPARATOR COMPANY

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST.  
Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Acme Ensilage Cutters and Blowers, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Send for special catalog.

## Come to Stanislaus County for Registered Holsteins

STANISLAUS COUNTY LEADS

All counties of California in number of herds of registered Holsteins and number of 30 pound sires in service.

### Pelandale Holsteins

Headed by Hazelwood Mercedes Posch Ormsby. Good young bulls and a few registered cows for sale.

J. A. Pelanda, Rt. B, Modesto, Cal.

### Segis Pontiac De Kol Dutch

Whose three nearest dams are 1000 pound cows that average over 30 pounds in 7 days, heads my herd. Bull calves for sale.

E. E. Freeman, Rt. B, Modesto

### Registered Holsteins

Young sons of Prince Hiske Walker out of A. R. O. dams for sale.

H. E. Cornwell, Rt. B, Box 183, Modesto, Cal.

### HOLMES STOCK FARM

Registered Holsteins of best breeding. Young bulls for sale.

R. L. Holmes, Modesto, Cal.

### White House Holsteins

A well bred proven herd sire for sale. also a few bull calves.

A. M. Bibens, Rt. 1, Box 307, Modesto, Cal.

### Thompson's Registered Holsteins

Young bull calves for sale with yearly record backing.

Luther Thompson, Rt. A, Box 351, Modesto, Cal.

Our Senior Herd Sire is KING KORNDYKE HENGVERELD ORMSBY 7th Five of his sisters sold at public auction for \$23,800, an average of \$4760.

This blood has made some of the world's greatest producers. Our junior herd sire is TOYON KING KORNDYKE SOLDENE, son of a 33.25 pound daughter of King Hengerveld Aaggie Fayne. Young bulls for sale. No females.

REGISTERED BERKSHIRE BOARS, sons of the \$1500 boar Star Leader, for sale.

Kounias Registered Stock Farms, Modesto, Cal.

## Creamcup Holsteins

Headed by the 33.92 pound bull Creamcup Champion Pontiac Burke. A few young bulls for sale. M. M. HOLDRIDGE, Rt. A, Box 437, San Jose, Cal.

When writing advertisers, mention The Cultivator.

him. Tags, bucks, black, and other recognized discount fleeces will be paid for at prices fixed by the government. Bags will be paid for in the same manner.

#### Payments to Growers

Growers shall be entitled to payment on a basis of the date of the arrival of the wool, as shown by the railroad receipt. However, as it would be impossible for obvious reasons to make settlement on each clip on the date of its arrival, in order that the grower may lose nothing by any delay in settlement he shall be entitled to draw interest on the selling price of his wool, less freight, from the date of the wool's arrival until the date of final settlement.

Final returns will be made as promptly as possible in all cases.

#### Commissions

The grower does not pay the commission or compensation for handling wools in the designated distributing centers. This commission or compensation for handling will be added to selling price of the wool and paid by the buyer.

If sold in the original bags the commission or compensation shall be 3 per cent of the selling price. If the wool is graded the commission or compensation shall be three and one-half per cent of the selling price. This commission or compensation includes drayage, storage, and insurance for a period not exceeding on any lot six months after arrival. On any lot remaining unsold in his possession for a longer period than six months the dealer shall be entitled to charge storage and insurance at the market rate, and this additional charge shall be added to the price of the wool.

#### Mills

In order that the government may have full control of the wool situation with a view to conserving, as far as may be necessary, the wool supply for military purposes it is considered necessary to prohibit manufacturers from buying wool except in the designated distributing centers, and then only with the permission and consent of the government, under such regulations as the government may hereafter make.

However, mills located in wool-growing districts not near to the designated centers of distribution, and which are working on government orders, will be given permits through the wool division of the war industries board to buy certain amounts of wool in their immediate neighborhood. In making applications for such permits, the manufacturer applying should state the number of his government order, the amount of goods yet to be delivered against such order, the amount and class of wool required to complete said order. The manufacturer receiving such a permit will be required to report to the wool division of the war industries board all purchases made against permit issued to him.

#### Permits to Dealers

All dealers in approved centers desiring a permit to operate should apply to the wool division of the war industries board, stating their capacity for storing and grading.

All country dealers should apply for a permit to operate by writing to the wool division of the war industries board, giving name and address.

In order to expedite movement of wool, dealers in country districts and distributing centers may operate immediately in accordance with the above regulations, pending application for and granting of permit.—Lewis Penwell, Chief of Wool Division, War Industries Board, Washington, D. C.

## Northern California Notes

Written for California Cultivator By W. S. Guilford

### BIG WHEAT CROP IN SHASTA AND ADJOINING COUNTIES

SOME of the best wheat ever grown in the state will be harvested during the next three or four weeks in Shasta and the other northern counties of California. There is much agricultural activity in all of this rich section.

The Northern California Counties Association is one of the most active and most efficient organizations in the state. Dudley V. Saltzer is the president, Walter H. Chase secretary. The principal office is Redding, but meetings of the board of directors are held each month in a different county. Five counties are included

in the organization, Trinity, Modoc, Lassen, Shasta and Plumas.

With the solid support of such an organization the work of the Shasta County farm adviser, Guy Talbot, is made easy. Pig clubs and pure bred bull calf clubs are among the progressive agricultural things in prospect.

The range cattle interests in these counties produced a large revenue and a large supply of beef and leather for the army. The recent meeting of the Northern California Cattlemen's Association at Redding was attended by President L. A. Nares of the California Cattlemen's Association. President Wm. Judkins, Secretary M. T. Lack and E. A. Null were appointed

to represent the northern association at the conference to be held at Davis June 26 to 27.

State Forester G. M. Homans was also in attendance in the interest of fire protection to the forest ranges, pastures and grain fields. He is doing great work in the organization of fire companies for the protection of local areas.

There are splendid crops on the Anderson irrigation project, and water is now being delivered everywhere. The diversion is made from the Sacramento River through a tunnel that runs under a part of the town of Redding.

### VALUE OF GOOD BLOOD ILLUSTRATED

I have seen many illustrations of the value of good blood in live stock, but none more striking than one recently observed.

With A. H. Culver, a prominent

## How the Armies' need for meat was answered

IN a fighting man's ration, meat is the important item. Twenty ounces of fresh beef, or its equivalent, is called for daily.

To supply the meat needs of an army that was suddenly expanded from 100,000 to 1,500,000 is a tremendous task. Added to the needs of the Allies, it is a staggering one.

The American stockman and the American packer may justly take pride in the way they have met these needs.

During 1917, stockmen sent to market nearly 2,000,000 more cattle than during 1916. Yet at the end of 1917, the Department of Agriculture reports more cattle remaining on American farms than at the beginning of the year. The production of hogs has also been increasing. All of this in spite of high feed prices, and scarcity of labor.

How the packers have done their part is shown by the fact that in one week, Swift & Company was called upon to supply the Allies and the American Armies abroad 24,000,000 pounds of meat and fat—enough to

have fed America's peace-time army for more than six months.

An order of this size means the dressing of 13,000 cattle and 200,000 hogs.

To move the finished products, 800 freight cars were needed. Of these 650 were from the Swift refrigerator fleet.

Three days after the order was received by Swift & Company, shipments began, and the entire amount was rolling seaward within a week.

Since January 1, 1918, over 400 carloads of our products per week have been shipped abroad on war requirements.

The nation's meat supply machinery has stood the test.

Not once has there been a failure on the part of the American farmer or the American packer to supply the government's needs.

On their part, Swift & Company performs their service without governmental guarantee of profit and with a limit of 9% return on capital employed in the Meat Departments, which means about 2 cents on every dollar of sales.

Swift & Company, U.S.A.

Glenn County sheep grower and farmer, I was watching a flock pass down a road at Butte City Ranch. We bought a lot of old ewes last fall and bred some of them to Shropshire rams from our registered flock. The others had been bred to a common lot of rams.

As far as you could see these lambs the Shropshires could be easily recognized. They are blockier, fatter, have more meat over the back and in the leg of mutton. If you could not see their black faces you would know they were far superior to anything else in the flock. They have more bone, stronger legs, and more vigor and vitality.

Since mother has taken to knitting for soldiers the titular head of the house says that many of his socks celebrate feetless day.

## Conserve Stock Feed

Anticipating a critical shortage of both cultivated and natural feedstuffs for stock cattle in California after August 1, the federal live stock commission of the United States food administration for California has issued an appeal to farmers to conserve straw of all kinds which can be used as a base for cattle feed.

Prof. Gordon True, chairman of the federal livestock commission of the United States food administration for California, issued the following statement:

"The range cattle situation for the year 1918 is critical.

"The rains of the past season came too late to put the ranges of the state into anything like normal condition. The result is an unprecedented shortage of cattle feed.

"It is too late to extend irrigated crop areas for this year. The situation must be met by saving where there has formerly been waste. This means that every pound of straw from beans and all the grains must be most religiously stored for feed.

"The food administration is taking the stand that the burning of any straw will be regarded as wasteful practice and the man who does it may expect to be prosecuted under the federal law.

"On account of the needs of the cattlemen the citrus and deciduous fruit growers are urged for this year to abstain from the use of bean straw and alfalfa as fertilizer or mulch. The cattlemen on the other hand are as strongly urged to conserve every pos-

sible pound of manure for the use of the fruit growers in lieu of the straw usually taken by them.

"The destruction or waste of anything that can be used as a stock feed or as a fertilizer at this time is a national calamity."

### NEW DAIRY COW CLASS AT THE STATE FAIR

At the request of the California Jersey Breeders' Association, the board of directors of the State Agricultural Society has consented to add another class to the regular classification of the dairy breeds in the premium list for the coming state fair, August 31 to September 8. This class will be for five cows in milk, with first, second and third money.

It is the intention of Jersey breeders to offer a handsome cup in connection with this class in the Jersey classification, this cup to be awarded annually to the first prize winner, and the breeder winning it the greatest number of times in five years to own it permanently. The name of the winner each year will be engraved on the cup, with the date of his winning it.

The state fair management has also assured the Jersey breeders in compliance with their request that they will make every effort to provide some kind of living accommodations for the men in charge of stock at the fair this year. This is a much needed improvement that will be greatly appreciated by the live stock exhibitors.

### GOVERNMENT SETS WHEAT FEED MILL PRICES

Decided reduction in prices for wheat mill feeds have been ordered by the United States food administration, which calls attention to the fact that the price of mill feeds is a decided factor in the ultimate cost of many feed commodities. Although it has brought about a general downward movement in mill feed prices, the food administration points out that the amount of wheat mill feeds to be obtained is small in proportion to the demand and that the most practicable means of reducing feeding costs lies in a more general use of the coarse grain by-products which may now be had in abundance. Hominy feeds have lately declined about \$25 a ton, and rye and barley feeds have fallen in proportion.

#### Based on Wheat Price

Under the new schedule prices are still based on the price of wheat. The maximum bulk price of bran bears the same relation to wheat as formerly—38 per cent of the average cost to the mill. The price of flour middlings, which was \$9.00 per ton above the price of bran, has been reduced to a differential of \$2.00. Red dog, which bore a differential of \$15, has also been reduced to \$2.00.

Mixed wheat feed prices, which were \$4.00 per ton above bran, must now be no more than \$1.25 higher. Shorts, standard middlings, gray shorts, and gray middlings now bear a bulk price that must not exceed bran by more than \$2.00 per ton.

### HOLSTEIN AWARD FOR CALIFORNIA

Two of California's fairs, the state fair at Sacramento and the liberty fair at Los Angeles, have been honored by the following awards from the Holstein-Friesian Association of America.

#### State Fair

Twenty-five per cent cash to be paid on the general classification. In the three-day butter fat test, in each class, a silver cup to the first prize winner, if a registered Holstein.

#### Liberty Fair

Twenty-five per cent cash to be paid in the general classification.

# The Opportunity of a Lifetime

It is not likely that within the span of life of most of us will so large a herd of registered Jerseys of such outstanding quality as that of the N. H. Locke Company herd, be dispersed again at public auction in California, and their sale is indeed the opportunity of a lifetime.

The herd has been a member of a cow testing association for a long time and only the best producers have been retained as workers and breeding females, with the result that this herd is admittedly one of the highest producing large herds in the country, and it has been handled strictly under ordinary dairy conditions.

The records of the cows will be shown in the catalog, now in preparation, and everyone who wants some real producers should study it carefully.

Every cow in salable condition in the herd will be sold, including all the famous show winners and their sons and daughters, from Empress Lass right down to winners in the calf classes, the entire sale numbering

**85 Registered Jersey Cows in Milk**

**20 Registered Jersey Bulls of Service Age**

**25 Registered Jersey Heifers and Young Bulls**

The great herd sires King's Valet, Borello's Golden Laddie, Grace's Fox of Venadera, and Norma's Gertie Son of L, will be in the sale which will be held on the farm of

# N. H. LOCKE CO.

Lockeford, California

## Thursday, June 27, 1918

THIRTY-FIVE DAUGHTERS OF KING'S VALET, are without a single exception the greatest group of daughters of a Jersey sire ever sold in one sale in the west. Twenty-eight of them are now in milk and making money every day. ALL OF THE DAUGHTERS OF BORELLO'S GOLDEN LADDIE will be sold, and most of them are in milk. They are a wonderfully good lot with great, deep bodies, good udders and teats, strong rugged individuals and regular dairy workers.

FOURTEEN DAUGHTERS OF VALET'S KING OF L are a choice group of young cows, most of them with first calf, and they are GOOD.

THREE DAUGHTERS OF GERTIE'S LAD are top notchers, and nothing more need be said about them to those who know Jerseys.

And do not overlook the fact that this sale will be conducted under the regular sales contract of this company, every animal positively guaranteed to be a breeder, every animal pledged to absolute sale, every animal tuberculin tested and SOLD SUBJECT TO TUBERCULIN RETEST BY THE BUYERS.

MAKE YOUR PLANS NOW to be at the sale early in the morning, for the large number of cattle to sell makes it imperative for us to begin the sale promptly at 9 o'clock in the morning, Thursday, June 27.

There are limited hotel accommodations at Lockeford, but to be safe it is well for buyers from a distance to make hotel arrangements at Lodi which is only 7½ miles from Lockeford on the main line of the Southern Pacific, and a jitney service will be arranged between there and the farm.

Catalog of the sale will be ready for distribution about June 20. Make your request for one as early as possible as inquiries already on hand indicate that there will be a very large number to mail out.

## GRAIN FOR SKIM MILK CALVES

In substituting skim milk for whole milk in calf feeding, the change should be made gradually, and at about the same time a small quantity of grain can be placed before the calf to offset the loss of nutriment contained in the butter fat of whole milk. The substitution of skim for whole milk may be started after the calf is three weeks old, depending upon the size and vigor of the animal, and the transition period extended over a week or two.

For the average farmer or dairyman, perhaps the most convenient grain to feed is ground corn, and this serves as a very good supplement to the skim milk, says M. H. Fohrman of the University of Missouri college of agriculture. At first a small handful is all the calf will take, but the amount can be increased gradually. Corn is palatable and overfeeding should be avoided.

While corn is palatable, and an excellent feed for supplying energy, it is deficient in protein and lacks growth producing materials. Because protein is so essential to growth of young animals, it is well, when the calf grows large enough to eat a pound or more of grain per day, to supplement the corn with other grains and alfalfa hay.

A good grain mixture to feed to growing calves is made up of 500 pounds ground corn, 300 pounds ground or whole oats, and 100 pounds linseed oil meal. Where oats are high in price or off the market, the amount can be reduced or oats may be left out entirely. However, they make this mixture more bulky and also add to its palatability.

To assist in the development of the digestive organs, the young animals should have some hay. Nothing fills this requirement quite so well as alfalfa hay, which is not only palatable, but high in protein and a carrier of growth essentials. Caution is again required in feeding this hay as calves may eat too much.

## USE PUBLIC WEIGHMASTERS

State Superintendent of Weights and Measures Johnson urges that all farmers making shipments secure the services of public weigh masters, either at point of origin or at point of destination of shipment.

It is stated that through use of these public weigh masters the farmer will avoid any question of fraud in connection with his shipments.

Johnson recommends that where there is a public weighmaster at point of origin the sale of farm products should be made subject to point of origin weight. If, however, shipment is subject to point of destination weight, the farmer may in all instances rely upon such weights being accurate. Under all circumstances public weighmaster's certificate of weight should accompany shipment and such record of weight should form the basis of settlement.

## SWINE MORTALITY FROM DISEASE

The death rate in swine from all diseases for the year ending March, 1918, announced by the United States department of agriculture as 42.1 per 1000, is the lowest in 35 years, according to the records kept during that period.

This unprecedentedly low rate of mortality presents a great contrast with those of earlier periods, particularly with the losses of 133.8 per 1000 in 1887, 144 per 1000 in 1897, and 118.9 per 1000 in 1914, years

marked by severe outbreaks of hog cholera. This is even a remarkable reduction from the normal low rate of losses which has remained slightly above 50 per 1000 when the disease was least prevalent.

The Bolsheviks are now eating bread made of straw. All they need now is to learn how to bray and the transformation will be complete. — Macon Daily Telegraph.

# 100 Registered Holstein Cows

## 25 Registered Holstein Heifers and Bulls

will be sold at Public Auction to the highest bidder for

## A. W. MORRIS &amp; SONS CORPORATION

Woodland, California

to be held at State Fair Grounds

Sacramento, Thursday, July 11, 1918

The cattle in this sale will offer an unique and most unusual opportunity to secure a large number of wonderfully well bred and high record females in calf to sires who are making Holstein history today. Just consider this partial list of the offering:  
THREE 30 POUND COWS with records up to over 33 pounds.

THREE COWS with yearly records above 1000 pounds butter in one year.

FOUR DAUGHTERS OF IGNARO DE KOL with yearly records up to over 900 pounds butter.

FOUR DAUGHTERS OF DE KOL BURKE, all with good records, one of them a 32 pound four year old.

FOUR DAUGHTERS OF PRINCE GELSCHKE WALKER, including Miss Gelschke Walker Korndyke, former state record junior two year old.

THREE DAUGHTERS OF SEGIS PONTIAC DE KOL BURKE, including a 19 pound junior two year old and a 20 pound first calf junior three year old.

TWO 29 POUND COWS.

TWO 28 POUND COWS.

THIRTY-EIGHT YEARLY RECORD COWS with records up to over 1000 pounds butter.

TWENTY-FIVE COWS bred to King Mead of Riverside.

TWENTY COWS bred to Prince Gelschke Walker.

Among the great cows to be sold are such famous individuals and producers as Pet Salambo of Riverside, Luit Burke, Pauline Creamelle Mercedes, Leda Gerben Alcartra 2nd, Hartog Creamelle De Kol, Susie De Kol Canary Mercedes Burke, Laura Netherland Gerben 2nd, Pearl Beets 2nd, Lady Dione Walker, Lady Pontiac Mead, Miss Blaney Pondyke.

There will be about 15 fresh cows in the sale, and a very large number are five and six months along in calf. The entire 100 cows will be bred, most of them have been in calf several months now, and they are bred principally to King Mead of Riverside, Prince Gelschke Walker, and King Morco Alcartra. The balance are bred to Sir Aaggie De Kol Acme and King Korndyke Pontiac 20th.

Catalog now in preparation. Write for one.

## Cutter's Refined Germ-Free Anti-Hog Cholera Serum

*Produced in the Most  
Up-to-date and Best  
Equipped Anti-Hog  
Cholera Serum Plant  
in the World.*

Does away with the risks that necessarily attend the use of a serum that is not germ-free.

It is 20% more efficient, measure for measure, than the old type, "bloody" serum, is much more quickly absorbed, does not discolor the flesh at point of injection, and carries no liability of producing abscesses.

80 c.c. of Cutter's Refined Germ Free Serum is just as efficient as 100 c.c. of the best old type "bloody" serum.

But we make the old type serum, and do the job so well that though we have sold several million c.c. since we started production in 1917, there has been not even one complaint of failure to protect, or of bad effects following its use.

So, whether you use the old or the new kind, insist on "Cutter's," for in either case you will be getting the best that can possibly be produced.

Remember, a serum may be "clarified," or "clean," and still not be germ free. Such a serum is almost as dangerous as a "bloody" serum. Cutter's Refined Serum is not only clear but it is Germ Free.

Write for our two new booklets, "Hog Cholera Prevention," and "Special and Detailed Information Concerning Hog Cholera Immunization." From the latter you will learn what constitutes good work and why a competent veterinarian should be employed.

### Prices.

Cutter's Refined, Germ-Free, Anti-Hog Cholera Serum is 2½ cents per c.c.

Cutter's Regular, or "old type" Serum, is 1½ cents per c.c.

Cutter's Hog Cholera Virus, for use with either type of serum, is supplied at 1½ cents per c.c. It is dependable.

We prepay shipping charges.

Let your veterinarian order for you and encourage him to be liberal in estimating the amount of serum to use; safety lies in giving more than may be needed rather than trying to figure too fine.

Should he be prejudiced in favor of some other serum, there is a reason that concerns him but not you, except insofar as it should make you more insistent that Cutter's Serum be used. In such case do your own ordering direct from us. You will get "Cutter's" promptly, prepaid.

## Care of Brood Sow

By William Hislop

THE brood sow is the foundation of our future pork supply. Her importance is not appreciated until we stop to consider that all the future porkers produced on the farm must be under her care for almost six months of the year. From the time of breeding to the time of farrowing there are 114 days. From birth to weaning there are from 42 to 60 days.

The essential points of brood sow management are as follows:

Provide suitable food, but do not overfeed.

Keep the sow growing thriftily but do not fatten.

Devise schemes to make the sow take exercise.

Provide a warm, dry, well bedded, well ventilated and sun lit house.

Feed and exercise so as to avoid constipation.

Avoid radical changes in the rations.

Kill off lice with crude oil and drive out worms.

Practice gentleness at all times.

You can not afford to neglect any one of these points. Lice, worms, constipation, and no exercise will cause much trouble before, during, and after farrowing, if not given attention and remedied. Insist that the sow take plenty of exercise. Shut her from the house in the middle of the day, rather than have her huddle up and snooze peaceably. Feed her on that side of the yard or field opposite the sleeping house. Provide hay in racks, the eating of which compels her to take exercise. If the proper kind of feed and exercise do not keep her bowels in good order, give her, in slop, one ounce of epsom salts per 100 pounds of live weight. For worms, give six grains of Santonin and four grains of calomel per 100 pounds live weight after 18 hours off feed. Give it in a thin short slop. A little crude oil rubbed on her back will kill all the lice and nits that cause so much uneasiness.

### Before Farrowing

For 60 days before farrowing the sow should get from one-half to three-fourths more grain than she received during the winter months, because nine-tenths of the weight of the unborn young is deposited during that time. However, do not overload the sow with fat, for the very fat sow is apt to be clumsy with her pigs, and sometimes her pigs are few in number and lacking in strength and vigor. On the other hand, the very thin sow will either not do justice to her pigs, or will become a wreck herself during the time she is nursing her litter.

### Ration

1. Fifty pounds ground oats, 50 pounds middlings, alfalfa or clover hay in rack; or

2. Seventy-five pounds barley meal, 10 pounds tankage, 15 pounds chopped alfalfa hay; or

3. Forty-five pounds ground oats, 45 pounds barley meal, 10 pounds tankage, alfalfa or clover hay in rack.

In cold weather, when fed out of doors, very little water should be used in mixing the feed. It will be better to furnish water separately. Feed a few rutabagas or carrots in addition to above rations.

A record should be kept of the date of service of the sow so that the date of farrowing will be known in ad-

vance. A week or ten days before farrowing, the sow should be placed in the farrowing pen so as to become accustomed to her surroundings before the pigs are born. In the farrowing pen there should be a rail set eight inches from the floor and eight inches from the wall, to prevent the sow from lying on her pigs. Use only a small amount of bedding, preferably cut straw.

### At Farrowing

It pays to keep the sow quiet. If the sow is restless, place the pigs in a well warmed basket until all are born. Place the pigs at a teat to suck as soon after as possible. Hogs never fail to respond to good care. Good treatment always means contentment, with its corresponding profits.

### After Farrowing

For a few hours after farrowing give the sow nothing but a drink of water that has been warmed to remove the chill. After 18 to 24 hours, give her a warm feed of thin shorts slop. During the next three days exercise great care not to overfeed. Make the slop a little thicker each day. After that gradually increase the feed, taking ten days to reach full feed of either of the following:

### Rations for Nursing Sows

1. Thirty pounds barley, 30 pounds oats, 20 pounds middlings, 12 pounds bran, eight pounds tankage.

2. Fifty pounds barley, 20 pounds shorts, 15 pounds bran, ten pounds oil meal, five pounds tankage.

3. Fifty pounds ground oats, 50 pounds wheat middlings soaked between feeds. If sweet skim milk can be added to the mixture, it is almost ideal.

If possible, provide roots and green feed; they keep the sow healthy. Encourage pigs to eat grain after they are three weeks old, and build a creep for them to feed along.

Castrate boar pigs one week before weaning. After weaning cut down feed of sow, to check milk flow. Feed sow dry oats for a few days after weaning. If her udder gets full turn her in with pigs once a day for a few days.

### Ration for Pigs After Weaning

1. Sixty pounds barley meal, 32 pounds shorts, eight pounds tankage; or

2. Seventy-seven pounds shorts, 23 pounds skim milk.

Give them rape, rye, clover or alfalfa pasture; and market from 175 to 200 pounds, provided they have the finish and quality that the butcher wants.

### EAT COTTAGE CHEESE INSTEAD OF MEAT

Cottage cheese should be eaten in generous quantities, not as a relish, but as a food. It is a satisfactory substitute, pound for pound, for lean meat and for eggs, if the iron that it lacks is provided elsewhere in the meal in the form of salad, pot greens, vegetables, whole cereal breads, or breakfast foods. The consumer who uses cottage cheese instead of meat performs a war service. In any meal in which cottage cheese is used, therefore, it should take the place of the more expensive meat or eggs. Circular 109, Office of the Secretary, United States Department of Agriculture, Washington, D. C., offers helpful suggestions on ways of serving cottage cheese.

## Field Notes from the Live Stock Men

"Food will win the war," and in the first line trenches of the battle of producing the food that is going on in the country are found Holstein cows. Steadily they are increasing their already enormous capabilities to produce milk and butter fat in vast quantities. The latest world's champion of the Black and White breed is Superba Palmyra 314141 (twin), who deserves a medal for breaking the record for butter fat production in the junior three year old class. She freshened at the age of three years, five days, and in seven consecutive days produced 655.1 pounds of milk yielding 38.35 pounds of butter. Superba Palmyra's sire is King Segis Pontiac Columbo 105152; her dam is Bloomingdale Hengerveld Palmyra 98725. She was bred and is now owned by Oliver Cabana, Jr., Elma Center, New York.

Cornell University has one of the greatest cows the Holstein breed boasts. She is named Glista Ernestine and was bred and developed by the university. In seven days this remarkable cow made 35.96 pounds of butter from 823 pounds of milk and for 30 days made 149.86 pounds of butter from 3285.9 pounds of milk. This record is most remarkable when it is considered she made this record immediately after the completion of the yearly test of 1042.5 pounds of butter from over 23,000 pounds of milk. Freshening as a four year old, Glista Ernestine made 30.51 pounds of butter, and for each of her four lactation periods since that date she has crossed the 30 pound mark, and each time has increased her record considerably.

The Jack London Ranch of Sonoma County recently sold six Shorthorns to the Rogue River Valley Canal Company, Oregon. Lady Sunshine, shown at the San Francisco Land Show, was one of the animals, and the consignment included the prize bull, Chardon, and the heifer, Wildeye Princess, first prize at the land show.

A consignment of 200 head cattle, owned by U. B. "Butte" Tyler, and 75 head from Ramsay & King, were shipped from Red Bluff last week.

A Red Cross auction sale will be held at Davis at the time of the beef cattlemen's conference June 27-29. The calf selected is to be called Red Cross Calf and is the great grandson of the Shorthorn bull Whithall Sultan, one of the most noted animals of the breed. He was donated to the California Cattlemen's Association for the sale by Butte City Ranch of Glenn County, of which W. B. Dwyer and W. S. Guilford are the proprietors. He is sired by Victor Stamford.

The La Conner Flats Stock Farm Dispersal Sale of registered Holsteins, owned by J. H. Hulbert and conducted on his farm at Mount Vernon, Washington, May 25, was one of the most successful sales ever held in the Northwest. Out of a total of 81 animals sold 58 head were young things including bred and unbred heifers, heifer and bull calves, and quite a number of the cows were over 11 years old and some of them with lost quarters. The star of the sale proved to be the great world's record heifer Ormsby Segis Marie, who fetched the highest price ever paid for a cow on the Pacific Coast, going to Toyon Farm Association, San Jose, for \$12,500. She is one of the outstanding young matrons of the breed and Toyon Farm Association is to be compli-

mented upon their success in bringing her to California. The next highest price of the sale was realized on Lannoner Pontiac Segis, the young son of Ormsby Segis Marie, who goes to head the registered herd owned by Youngquist Brothers, Mount Vernon, Washington. A feature of the sale was the fact that outside of the animals that came to California practically the entire herd went into the hands of dairymen who are just starting pure bred herds, not a few of them right in Skagit County. One of the heaviest buyers was Elmer Axelsson, Mount Vernon, who secured a beautiful string of heifers including a 26 pound three year old and some two year olds with good records. J. P. Hayton, Mount Vernon bought a number of the best of the younger heifers and made unusually keen selections. Toyon Farm Association, San Jose, were contenders for the tops throughout the entire sale and could not be stopped on the animals they really wanted. Besides Ormsby Segis Marie, they bought the two times 30 pound cow Ferndale Countess De Kol and her two daughters, the 23 pound cow Albina De Kol Hartog and her three daughters, securing all of the top females from Mr. Hulbert's show herd that won throughout the Northwest last year. J. E. Peck of Imperial County, was another frequent bidder on the good ones and he was fortunate in securing six choice heifers. At the close of the sale a bull donated by Mr. Hulbert was sold for the benefit of the Red Cross and netted just over \$700. The sale was conducted by California Breeders' Sales and Pedigree Company, Sacramento, with C. L. Hughes in the box, Col. Ben A. Rhoades, Los Angeles, on the block, and Col. J. W. Hughes, Oregon and Col. Harry C. Cranke, Idaho, in the ring. The 81 head sold for a total of \$37,085 averaging as follows: 23 cows sold for \$20,675 average \$899; 36 heifers sold for \$11,680 average \$324; seven heifer calves sold for \$1375 average \$196; 12 bull calves and one yearling sold for \$3015 average \$232.

Toyon Farm Association, San Jose, secured the services of Charles Mac Donald to take charge of their breeding farm. Mr. Mac Donald has been in charge of J. H. Hulbert's La Conner Flats Stock Farm, Mount Vernon, Washington, and it was under his care that Ormsby Segis Marie made her world's record. With his successful experience and a good herd to develop at Toyon Mr. Mac Donald is quite sure to be heard from later on.

H. E. Cornwell, Modesto, recently shipped a fine registered Holstein bull by express to Ivy Condrion, Coos County, Oregon. This young fellow, De Kol Ciruela, is out of Abbie De Kol of East Bank 2nd, the great cow that won third place in California Dairy Cow Competition with a production of 656.61 pounds butter fat in ten months. She has an official record of 26.50 pounds butter in seven days, and her record made in the competition was semi-official.

Grant A. Brown, El Monte, has completed two good Register of Merit records on registered Jersey females that he bought in the C. G. McFarland sale at Tulare last year. Jennie of Willowwood, a five year old, made Class AA record of 8620.4 pounds milk and 493.98 pounds 85 per cent butter. The junior two year old Lot-

Continued on Page 707

PURE BRED

REGISTERED HOLSTEIN

### Prince Gelsche Walker Korndyke

shown above, is a money maker right today for every man who is fortunate enough to secure one of his good young sons.

At the moderate prices at which we sell them, there is margin for a very substantial profit in the increased value that is sure to come just as soon as his daughters begin to go on official test, which will be within the next few months.

Remember that we are not selling any daughters of Prince Gelsche Walker Korndyke. We are developing what we think is a really high class herd, and we have not been able to find any females that we judge are superior to the daughters of this great sire as foundation females.

Why not take our tip and buy one of his young sons now, and join the ranks of the many dairymen who will benefit through our official test work? Remember that we extend liberal terms and sell at moderate prices.

### King Korndyke Pontiac

is shown below, and he is being bred to practically all of the daughters of Prince Gelsche Walker Korndyke.

### JANE GARDEN FARM

SACRAMENTO - CALIF.

FRED W. KIESEL PROP'R. C.W. YOUNG Supt.

## PRINCE RIVERSIDE WALKER

represents about the best combination of Walker-Mead breeding that we know of, and on top of the wonderful records made on both sides of his family, including several world's records, there is a big future ahead for the large number of his sisters and other near female relatives yet to be tested, and who are about to add further honors to already well proven families.

We have only a few bull calves by Prince Riverside Walker to offer. Dairymen who know take them away from us long before they reach service age. You might find one here that would just suit you. Give us a call or write your needs.

Our Entire Herd is  
Tuberculin Tested

### LUMBER

**Lumber-Sash-Doors-Plumbing-Supplies**—Building materials of all kinds. New and second hand \*A.R.W. shingles 60c per bundle. Send list for estimate. Dan P. (Mission Street) Dolan, 1620-1650 Mission Street, San Francisco.

### CATTLE

**Auction of a Complete Dairy**—75 grade Holsteins and 20 grade Jerseys. Herd in cow testing association for 3 years, records announced at sale; tuberculin tested regularly for the past 7 years, last test February 1, 1918, by a deputy state veterinarian, no reactors. Sold subject to tuberculin retest by the buyer. Holsteins mostly first, second and third calf granddaughters of King Segis Pontiac Emperor and Lorena Korndyke, both grand champion bulls at California State Fair. Jerseys bought as calves from the noted Mitchell herd that has been tested for butter fat regularly for ten years. All heifers in sale out of dams that made over 300 pounds butter fat in one year. The herd has been reduced half during the past year, retaining only the cows that made over 300 pounds butter fat in one year. Only two cows with blemished udders in the herd. Cattle loaded on cars free of charge. Will also sell one one ton Remington ice machine; brine tanks; pump; dairy equipment, including cans and jackets for shipping inspected milk; bottling machine; bottles, etc.; one fine saddle horse, weight 1200 pounds, and he is a beauty; six Percheron colts, growthy fellows with bone and substance. Owner donated heifer to be sold for benefit of Red Cross and Red Cross lunch will be served. Terms of sale \$100 and under, cash in hand; sums over \$100, six months time with bankable note at 7 per cent; a discount of 3 per cent for cash on sums over \$100 will be given. Sale will be held on Wm. Watt Ranch, 2½ miles northeast of Napa, California at junction of Napa Soda and Berryessa Roads, beginning promptly at 10 o'clock A. M., Saturday, June 16, 1918. Owner, Wm. Watt, Napa; auctioneer, Col. Cy. N. Clark, Modesto; sales manager, C. L. Hughes, Sacramento.

**For Sale**—Guernsey bull, Coras Reputation of the Rancho, 32102. Sire, Glenedette of Pinehurst; dam, Cora May. Born December 18, 1914. Bred by Knickerbocker Ice Co., Crystal Lake, Illinois. We are going out of the dairy business. This bull for sale at a sacrifice, price \$300. Floribel Farming and Cattle Co., Box 71, Hanford, California.

**SHORTHORN CATTLE, SHROPSHIRE SHEEP**, Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses, N. H. Locke Co., Lockeford, California.

**Shorthorns**—Several fine straight range bred bulls of high quality, ready for service, also some splendid yearling heifers. Fair Oaks Ranch, Willits, California.

**For Sale**—On account of dissolution of partnership will sell thirteen registered Guernsey cows. Choice individuals just in their prime. P. J. Weisel, Santa Fe Springs, California.

**Registered Holstein Bulls** from high producing dams for sale at reasonable prices. Also a few choice females. McAlister Sons, Chino, Cal.

**Registered Holstein Bull**—Straight, strong constitution, well marked, good pedigree. Write to Sunnybrook Ranch, Willits, California.

**For Sale**—One of Tehama County's best dairy herds. All fine grade Jersey cows, also young stock. Will sell in part or all. John Risse, Los Molinos, California.

**Venadera Jerseys**, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Ayrshires** (registered) — A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Arizona.

**Sunshine Farm Jerseys**—Bulls from officially tested dams for sale. E. E. Greenough, Merced.

**Five Fine Jerseys** for sale, three cows, two heifers, fresh and coming fresh, priced right. R. T. Waters, Box 68, Route 6, Bakersfield.

**For Sale**—One registered Guernsey bull four years old. Abram Marron, Jr., Box 10, Oceanide.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, Cal.

**Registered Jerseys**—1 yearling bull for sale. J. R. Carhart, Fullerton, Cal.

### PATENT ATTORNEYS

**Patents** that protect are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "Patents."

**Patents**—Copyrights, trade marks and labels registered. Solicitor of American and foreign. James R. Townsend, 712 San Fernando Bldg., Los Angeles. Phones: Home A4619; Sunset Main 347.

### AGRICULTURAL IMPLEMENTS

**IMPLEMENTS AND RANCH SUPPLIES**. Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC., The Yellow Front. Established 1892. 112-118 S. Los Angeles St., Los Angeles

### ENGINES

**Several New and Slightly Used Engines**, ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

**For Sale**—One 15-30 Gas Pull Rumley engine, cost \$2000.00, will take \$1500.00. Abram Marron, Jr., Box 10, Oceanide.

### AUTOMOBILE ACCESSORIES

**Fords** can burn half coal oil, all distillate, or cheapest gasoline, using our 1918 Carburetor; 34 miles per gallon guaranteed. Easy starting. Great power increase. Attach it yourself. Big profit selling for us. 30 days trial Money back guarantee. Styles to fit any automobile. Air-Friction Carburetor Company, 313 Madison Street, Dayton, Ohio.

## HOGS

BERKSHIRES GUERNSEYS  
GRAPE WILD FARMS

A few fall boars left by Royal Superbus—also a limited number of fall gilts. We have early spring pigs of both sexes and we are breeding some top gilts for fall farrow. Prices upon application.

A. B. HUMPHREY,  
Escalon, San Joaquin County, California.

**Make Big Money**—Pork prices jumping up. Breeding stock scarce. Next winter will see the greatest shortage of hogs and the highest prices ever known. Prepare now by getting some Whitten Ranch Poland-Chinas—the prolific, easy-feeding money-makers. Prices reasonable; satisfaction guaranteed; everything immune. Send for valuable free booklet, "Hogs for Profit." Ranch in Tulare County, but write R. H. Whitten, 519B Marsh-Strong Building, Los Angeles.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**"Billiken" Chester Whites**—The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar that is just 13 months old. C. B. Cunningham, Mills, California.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes,** weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Rancho Rubio Durocs**—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

**Mule Foot Hogs,** large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California, "The Blue Gums."

**Duroc-Jerseys**—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Callstoga, Cal.

**Large Type Poland Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, California.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, California.

**HEWITT'S BIG TYPE POLAND-CHINA** gilts and boar pigs. Hewitt & Hewitt, Dixon, California.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Berkshires**—A few very fine March farrow pigs, sired by Fair Oaks Champion. Fair Oaks Ranch, Willits, California.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

## GOVERNMENT LAND

**Be Patriotic**—Raise stock. Oregon, California openings. Valuable land marked plainly on County sectional map. \$2.50 any county. Booklet Free. Joseph Clark, Sacramento, California.

## FIELD NOTES

Continued from Page 705

tie of Willowood made 8482.5 pounds milk and 486.94 pounds 85 per cent butter. Both of the young cows are out of daughters of the good transmitting bull Philadelphia's Glory.

The announcement that A. W. Morris & Sons will sell 125 head of registered Holsteins from their big herd on July 11 will interest buyers from all over California. There are bound to be a great many real bargains in this sale, for the 100 head of cows offered are mostly all bred to the famous herd sires in the Morris herd and it will be an unparalleled opportunity to secure daughters and sons of these bulls at the modest prices the dams are sure to bring. The Morris herd numbers close to 500 head at the present time and after this sale they will still have the largest herd on the Pacific Coast.

W. C. Choisser, Riverdale, made his first purchase for the foundation of a registered Holstein herd at the North San Joaquin Breeders' First Consignment Sale at Modesto on May 9, and following the sale bought at private treaty from H. E. Cornwell, Modesto, the good heifer Mabel Ormsby Pietertje 3d, daughter of the butter fat winner at Fresno fair. Mr. Choisser is a Holstein enthusiast and plans gradually to build up a first class herd.

Wm. Lehfeldt, who is a newcomer in the San Joaquin Valley, secured an excellent start for a registered Holstein herd through his purchases at Modesto on May 9 where he was a consistent bidder on the good ones and succeeded in bidding last on several of them.

Dairymen all up and down the Pacific Coast are turning to pure bred registered dairy cattle in large numbers. It is the natural consequence of a little thought on the part of dairymen, and the feed and labor conditions that have prevailed for some time are certainly strong stimulant to thought. Good dairy practice means the keeping of good profitable cows, even in smaller numbers, and as an economic factor in dairying the pure bred registered cow is in a class by herself.

Leafy Veeman De Kol is the thirty-first 40 pound pure bred Holstein. She finished her test with a record to her credit of 589.7 pounds of milk yielding 40.10 pounds of butter produced in seven consecutive days. Her sire is Duke Wayne Veeman De Kol. Her dam is Leafy Dawn De Kol.

A fine boar which will show as a junior yearling, sired by Ames' Rival 100th, has been purchased by H. L. and E. H. Murphy from W. M. Carruthers.

RANGE CATTLEMEN'S MEETING  
AT UNIVERSITY FARM

The meeting of range cattlemen to be held at the University Farm on June 27 and 28 is a meeting to which the country organizations throughout the state are sending three or more delegates for the purpose of discussing a state wide organization of the beef cattlemen of California.

With the beef cattle industry of the state in a more or less critical condition on account of the inevitable feed shortage and the unusual range of prices due to war conditions, this is counted to be a most important meeting, the outcome of which may have a significant bearing on the future development of the cattle industry.

## BUTTE COUNTY CATTLEMEN

Men who have cattle or sheep ranging in Plumas forest reserve recently met at Oroville and organized that their interests might be better protected. Officers were elected as follows: President, Thomas Gianella of Honcut; vice president, Peter Carmichael of Table Rock; secretary and treasurer, George W. Ross of Wyandotte; members of advisory board, George Farnum of Palermo, W. M. Bills, John Bean and J. E. Rutherford, all of Wyandotte.

The president has issued a proclamation calling upon all to unite in celebration of Independence Day and to make it one of the most memorable since the birth of America's freedom on July 4th, 1776.

In commenting on the cruelties perpetrated by the Hun soldiers Harry Williams, a noted war correspondent in France, writes: "America must not expect civilized warfare; the only way to change the Hun heart is to put a bullet through it."

## Get Rid of Worms

Figure how much it's worth to you in dollars and cents to keep your hogs free from worms. Worms prevent thrift—retard growth—rob you of good, high-priced pork.

Dr. Hess Stock Tonic  
Drives Out the Worms

and at the same time tones and conditions the system. It enables your hogs to be at their best—to do their best. You take no chances. My Stock Tonic is guaranteed. You buy it at an honest price, from my dealer in your town who will return your money if it does not do as claimed.

Why Pay the Peddler Twice My Price?

## Egyptian Cotton for California

**R**ENEWED interest in the possibilities of cotton culture in the San Joaquin and Sacramento Valleys of California has resulted from favorable reports of experimental plantings in several localities last year. The danger of direct competition with the South can be avoided by growing a different kind of cotton. Instead of the short staple Upland type of cotton which is grown in the Southern cotton belt, it is now very distinctly to the advantage of the Southwestern farmers to plant Egyptian cotton, which is well adapted to the conditions of the irrigated valleys of Arizona and California. With cotton, as with every other crop, a failure to take into account the differences of the varieties may lead to costly mistakes.

### Results with Egyptian Cotton

The Egyptian cotton is very different from the Upland type, being a taller and more slender plant with narrower leaf-lobes and smaller bolls. This last feature often leads people from the South to suppose that the yield must be small, whereas, in reality the Egyptian cotton often yields very well, a 500-pound bale or more per acre having been obtained on many farms in the Salt River Valley of Arizona. Although some of the early

plantings of imported Egyptian seed gave very unsatisfactory results, much better behavior has been secured regularly for several years past from the varieties that have been bred in Arizona by the United States department of agriculture. About 30,000 acres of Egyptian cotton were grown in the Salt River Valley in 1917, with a return to the farmers estimated at \$5,000,000. Recent estimates from this and other valleys indicate that nearly 100,000 acres of Egyptian cotton will be planted this year in Arizona.

The Arizona varieties have been grown not only in the Yuma, Palo Verde, and Imperial Valleys of Southern California, but have been found well adapted to the southern part of the San Joaquin Valley, around Bakersfield and Fresno. Experiments have been conducted in this region for several years past. Further experience will be necessary before the Egyptian cotton may be considered as an assured crop in districts farther north, although the same varieties grew and ripened satisfactorily at several points in the San Joaquin and Sacramento Valleys last year. The season of 1917 may have been unusually favorable for the ripening of cotton in the Sacramento Valley, but even where rather low yields were se-

cured on account of late planting or other unfavorable cultural conditions, the results are considered profitable, and it is expected that more extensive plantings will be made this year, especially in some of the rice-growing districts.

### Farmers Must Work Together

Community organization of growers should be recognized as one of the chief requirements for establishing cotton culture in new districts. It is out of the question to produce adequate stocks of pure seed if different varieties are grown in adjacent fields or sent to the same gin. In addition to keeping the seed pure and thus maintaining the yield and quality of the crop, organized communities have an enormous advantage in relation to marketing, since they can offer commercial quantities of uniform, high class fiber.

### Advantages of Cotton in Cropping Systems

In some districts there is special need of such crop as cotton, that can be grown in rotation with rice, to rid the land of water grass or tules, which render continuous rice growing impracticable. Drainage will be a problem in some districts, but in others the water-table is at least three or four feet below the surface, and is not likely to interfere. Egyptian cotton is likely to be more useful than Upland cotton for shading out the grass, because the plants are larger.

Also there are many lands not now used, or yielding only small returns for grain or pasture, but likely to yield good crops of cotton, as recent experiments indicate. In many cases the food and fodder value of the seed alone might be much greater than that of crops now being raised for such purposes. The demand for cottonseed oil was increasing rapidly even before the war, and local supplies of cottonseed meal are needed by the live stock industry of California.

### GERMAN CIRCULAR DISTRIBUTED IN SPAIN TELLS WHAT TEUTON ARMIES HAVE ACCOMPLISHED

**T**HE department of state has received a copy of a circular which is being distributed by German propagandists in Spain setting forth claims as to what has been accomplished by the German armies. The authenticity of the document as being of German origin has been established.

The circular, which is in Spanish, states:

"Besides an untold amount of war material captured on the battle field, the Germans have taken possession of incalculable booty in France and Belgium, including:

High grade watches .....	417
Average watches .....	5,016
Underwear .....	18,073
Embroideries and women's handkerchiefs .....	15,132
Umbrellas and parasols .....	3,705
Silver spoons .....	1,876
Bottles of champagne .....	523,000

"These figures show a large increase over those of the campaign against France in 1870-71.

"In Belgium, besides many art treasures, they have confiscated old paintings valued at 3,000,000 pesetas.

### Forced to Teach Severe Lesson

"Due to the treachery of Cardinal Mercier and other priests, who did their utmost to stir the priests against the good hearted German soldiers, they were forced to teach a severe lesson to the Belgian and French Catholics.

Cathedrals destroyed .....	4
Rendered unserviceable .....	8
Churches destroyed .....	27
Rendered unserviceable .....	34

Total .....

"In Poland also a large number of churches have been destroyed for military reasons. The figures concerning these have not yet been published.

"As a result of the stupid stubbornness of the Belgian people in continuing the struggle after their bloody and final defeat on the battle field, the German officers were forced, against their will, to impose punishments on many rich individuals and wealthy cities. This has contributed the following amounts to the German treasury:

	Pesetas.
Punishments .....	87,000,000
Security .....	13,000,500
Reprisals .....	15,750,000
Forced contributions .....	4,320,850

Total .....

"This amount includes a fine of 15,000 pesetas imposed on the Alsatian children who insist on speaking the French language and refuse to study the beautiful German language. These statistics are a most useful warning to the neutral countries.

"If there are any still thinking of siding with the Allies, let them take warning from the fate of the others."

### Extent of Territory Occupied

In connection with claims of the extent of territory occupied by Ger-

## IHC Machines Best Substitutes For Scarce Hired Help

**T**HE American farmer produces more per man than any other farmer in the world. Using labor-saving machines, he produces record crops with less hired help than is required under any other system. Therefore, in the present crisis, with help so scarce, every farmer should use the most efficient farm machines he can get, the only kind that can be depended upon to make the necessary increase in production.

The International Harvester Company of America markets the full line of high-grade machines listed in this advertisement for disking and harrowing seed beds; planting and cultivating crops of all kinds; cutting, making and storing hay; cutting, binding and threshing small grains; harvesting, husking and shelling corn; shredding corn fodder, filling silos, fertilizing fields; skimming cream; and grinding feed. It sells efficient farm power machines, engines and tractors operating on the cheapest fuels a farmer can buy. It provides wagons and motor trucks for all kinds of farm hauling.

Many of these machines have been used by American farmers for close to seventy-five years. They have helped to establish the standing of the American farmer. They are better today, more efficient and more economical than ever before. In many cases, one or another of these machines will solve the hired help and farm power problems on individual farms.

International machines are sold through ninety branch houses and over thirty thousand local dealers. Any customer can place an order, or command the services of this organization, by a telephone call to the dealer, or a visit to the nearest town.

It is important this year that all orders for machines be placed as early as possible, preferably months in advance. See the local dealer, or write us about the machines you are going to need this year, and do it now.

man troops, the following footnote appears:

"When it is held that the Germans have occupied no English territory and that on the contrary they have lost all their African colonies, amounting to some 3,000,000 square kilometers, it must be remembered that the English, according to the declaration of their ministers, are not intending to secure any extension of the British Empire; that they have entered the struggle with only the aim of helping the Belgians. That is to say, the English have practically pledged themselves to return the German colonies after the war in exchange for the evacuation and indemnification of Belgium. The Germans, therefore, are to recover all that they have lost in Africa."

British Prisoners Taken

It is claimed in this document that more than 50,000 British have been made prisoners, and in this connection the following statement is made: "Although to these figures the English oppose 124,806 German prisoners taken by them on the western front, it must be remembered the English treat their prisoners with notable kindness (blandura notoria), while the regime imposed on the English prisoners by the Germans is one of extreme rigor; so that the Germans, with a small number of prisoners, have secured a much superior moral effect. Besides, to the 2264 officers and 51,325 soldiers, must be added the several thousand English prisoners that have died in consequence of disease, scanty food, and other accidents in German concentration camps."

Note: The foregoing figures regarding British prisoners refer to the total prior to the recent offensive.

FEDERAL EXPLOSIVES LAW

Under the new federal explosives act approved by the president October 6, 1917, and effective November 15, 1917, every person is required to have a license for the purchase, possession, sale, or use of explosives, or ingredients of explosives.

Explosives are dynamites, blasting and shotgun powders, caps and many other commodities listed in the act, as well as the component parts of these materials, which under the act are classed as ingredients.

The bureau of mines of the interior department is charged with the enforcement of this law. The director of the bureau of mines has appointed licensing agents for the issuing of licenses in every hamlet, village, town and city in the United States. In California we have over 700 licensors equipped and commissioned to issue licenses. The county clerk of every county in California is appointed a licensor. In almost every instance justices of the peace are appointed licensors, as well as notaries public.

Location of licensors, or other information regarding the federal explosives act can be obtained by communicating with John M. Griffin, United States Explosives Inspector for California at Madera.

ALFALFA WEEVIL

Phytonomus posticus fab., or to speak in more intelligible language, the alfalfa weevil, is of enough importance to alfalfa growers of Utah that the Utah agricultural college experiment station has issued Circular No. 31, given entirely to discussion of the habits of this pest and to methods of control. The first sentence of the report is rather startling. It is: "The alfalfa weevil is rapidly spreading over the entire alfalfa areas of the Western states." California is free from this pest, but it is of vital interest to every alfalfa grower that he should keep himself posted as to the pest, its nature of work, and be prepared to give aid by every control measure if the pest should enter the state. The first step, however, is to join the state and county horticultural commissioners in the effort to prevent its entrance. The insect was first discovered in Salt Lake County in 1904. It has spread in all directions from this first infested section into Arizona, New Mexico, Western Wyoming, and Colorado.

Fire Control

IN THE effort to secure more thorough control of fires so prevalent in California grain fields, fire companies have been organized, patrols have been established and thorough watch kept to prevent as much as possible the action of this destructive force. The gas tractor has been charged with being responsible for many of these fires, tractor people have been investigating, and a committee has been appointed to determine as to responsibility, and further recommend methods which would give assurance that the tractor will be provided with safety devices. The committee consists of L. C. Gauthier, chairman; W. G. Crisswell, and Prof. J. B. Davidson, and reports as follows:

- The following five points were considered:
1. Spark arrester or water arrester.
  2. Protection to manifold and exhaust pipe.
  3. Air cleaner.
  4. Care of machine.
  5. Extinguishers in field.

In regard to No. 1, spark arrester, it was shown that the use of water device was very unsatisfactory because of its being very large and causing more heat on the operator, besides causing back pressure on the engine, causing it to heat and not allowing it to give its full power.

It was also shown that the different companies are all working to get a suitable spark arrester to put on their tractors before the 1918 harvest.

No. 2. It was admitted that the fires set in grain fields were not from a tail wind when the straw and chaff were blown against the manifold and exhaust pipe. It was also shown that a straw could not be placed against either when hot as the heat rays would carry it away. But it was shown that in peat land where the ground will burn that it has been known that this dust settled on the manifold before it was hot and caked there and sometimes burns off. It is, therefore, necessary to protect them when working in such soil.

No. 3. An air cleaner is a neces-

sity as the dirt and dust taken in from the carbureter mixes with oil and carbon, later loosening up and going out through exhaust, carrying along burning oil.

No. 4. It was recommended that the service men of each company be instructed to caution the operators of tractors in regard to carbon and keeping their engines clean, also in regard to throwing dirty and oily waste where it could start a fire.

No. 5. All threshing rigs should carry fire extinguishers on the harvesters, for there is but one man on the tractor while there are four or five on a harvester, besides in case of fire it is impossible for tractor driver to leave his tractor as he must very often run to some safe place. Therefore, we would recommend that all farmers be advised to have fire extinguishers on their harvesters and to order them in time, for by waiting until the last minute they may not be able to procure them.

In regard to circulars to be sent to farmers concerning fires, the committee took exception to the gas tractor being considered the only fire demon and contended since it was not, it should not be so pictured for we had grain fires before there were gas tractors.

Therefore, all precautions should be taken for the prevention of fires.

Secret of their long life  
—special non-shrinking  
feature.

DURABLE  
REDWOOD  
  
PACIFIC  
REDWOOD  
TANKS

are holding water on three continents. Their remarkable long life is due to non-shrinking—the patent feature found only in PACIFIC TANKS.

Pacific Redwood pipe is scientifically built of seasoned lumber, clear, dried wood free from knots, splits or deadwood.

The staves are tongued and grooved, wound with galvanized wire, and rolled into a preservative to protect the wire from corrosion and rust.

Our engineers, with a world of experience, are at your service.

A PACIFIC Redwood tank and pipe outfit costs less to install than any other, and lasts twice as long. **INVESTIGATE.**

Redwood is the most durable of woods for exposure to all climates.

Water preserves redwood. Keep the channel filled with water. Joints are kept tight by water flowing down inside.

## BRENNEIS Two Row Riding BEAN CUTTER

IT SAVES ONE MAN'S  
TIME, DOES BEST WORK,  
SOON PAYS FOR ITSELF.

You cannot afford to lose time with old implements when labor is scarce and prices as high as they are this year. It's time to look ahead a little. If you order now you can get our fast TWO-ROW RIDING BEAN CUTTER made for California conditions in the great Ventura County bean fields. This machine has over 20 years successful experience behind it and our factory is here close at hand to back up every guarantee. This implement cuts two rows at once and draws the two rows of vines together. Each cutter is equipped with extra long blades, and convenient lever shifts to make the work accurate and easy. No bean ranch is complete without one of these economical labor saving bean cutters.

On account of the large crop the big demand for bean tools and the uncertainty of supply of steel, all orders should be placed at once, otherwise delivery is most uncertain.

## GRAIN

As to grain and feed prices see note  
 under Los Angeles grain prices.

Wheat—Government prices: Common  
 white hard, base price, \$3.50 per cental,  
 or \$2.10 per bushel of 60 pounds deliver-  
 ed in terminal warehouses in bulk; soft  
 white, base prices, two cents per bushel  
 less, or \$2.08 per bushel; white club (in-  
 cluding Sonora), \$2.00 per bushel. If  
 wheat, after cleaning, weighs 60 pounds  
 or more to bushel, base price stands; if  
 58 to 60 pounds to bushel, three cents per  
 bushel reduction; if 56 to 57 pounds six  
 cents per bushel less; if less than 56  
 pounds, grain becomes sample grain and  
 sells on its merits up to within one cent  
 per bushel of 56-pound wheat. Addi-  
 tional charge made for sacks.

## Citrus Fruit Market

Los Angeles, June 5, 1918.

Some dealers have ceased to handle  
 Valencia owing to the high price, but  
 the limited supply will doubtless hold  
 prices up. Southern strawberries are  
 filling the market and even Georgia  
 peaches are becoming something of a  
 factor. California cantaloupes are also  
 coming through and are selling around  
 \$3.00 to \$5.00.

Lemons seem to be on a speculative  
 basis and are commanding exceptionally  
 long prices.

## Shipments

Shipments of citrus fruits to date since  
 November 1, 1917: Southern California;  
 oranges 10,390, lemons 3116, total 13,506.  
 To same date last season: oranges 27,153,  
 lemons 4824, total 31,977. Central Cali-  
 fornia this season: oranges 2512, lemons  
 115, total 2627. Last season to same  
 date: oranges 4094, lemons 164, total  
 4258. Northern California; oranges 203,  
 last year same date, 845.

## AT THE AUCTIONS

May 29  
 New York: 14 oranges, 1 lem. Val.  
 5.00-7.80, Sweets 6.20-6.90, Grapefruit  
 1.20-1.45, lem. 6.65-7.60, Mikes halves,  
 2.90-3.50.  
 St. Louis: 2 cars. Val. 4.55-6.80,  
 Seeds 5.80, lem. 4.25-8.90.

May 31  
 New York: 13 oranges, 3 lem. higher.  
 Val. 4.60-8.70, lem. 5.35-7.30.  
 Boston: 10 cars. Val. 4.15-7.90,

 Grapefruit 1.10-1.60.  
 Boston: 16 cars. Val. 4.50-7.80, lem.  
 7.25-8.25.  
 St. Louis: 2 cars lem. 1 Val. Val.  
 4.75-7.20, lem. 8.75-9.25.

PARTIAL LIST OF CALIFORNIA  
FRUIT AND VEGETABLE  
SHIPMENTS

From post card reports to the bureau  
 of markets, United States department of  
 agriculture, Miss Hoey makes report of  
 the following shipment of cars of pro-  
 ducts from California for the week end-  
 ing May 27: Artichokes, 3; asparagus,

7; beans, 14; cabbage, 48; cantaloupes,  
 29; cherries, 28; dried apricots, 1; dried  
 figs, 2; dried peaches, 3; dried prunes, 7;  
 fresh peaches, 1; fresh peas, 2; green  
 string beans, 4; lettuce, 19; mixed fruit,  
 17; mixed vegetables, 65; mixed fruit and  
 vegetables, 3; mixed dried fruit, 2;  
 onions, 76; potatoes, 37; raisins, 18;  
 strawberries, 9; tomatoes, 12.

## WEEKLY REVIEW

Receipts of old potatoes are slowing  
 up. The gain in the volume of new far  
 more than offsets the decline. The move-  
 ment of potatoes amounts to more than  
 300 cars daily. The last week's receipts  
 of new stock were 2226 cars, or a total of  
 3100 cars. Maine and other Eastern po-  
 tato centers are shipping more freely  
 than a year ago this date. At North-  
 western shipping points potatoes are  
 ranging around 80 and 90 cents for sack-  
 ed stuff.

Florida cantaloupes are selling around  
 \$3.00 and \$4.00 in New York and Chicago.  
 California green meats range from \$7.00  
 to \$10.00 in standard crates.

Nearly 1100 cars of strawberries have  
 been shipped during the past week. This  
 is a material falling off, the preceding  
 week having been 1936 cars. Atlantic  
 Coast prices have ranged around \$3.00  
 to \$4.50 per 32 quart crates.

Texas is approaching the end of its  
 onion shipping season. Much inferior  
 stock has been offered. The volume of  
 movement is 40 per cent under that of  
 last year. Total movement is 3672 cars.  
 Old onions practically out of the market.

California cabbage has ranged around  
 \$2.00 and \$2.25 in Minneapolis and St.  
 Paul. Eastern markets supplied by Vir-  
 ginia and other southern sections.

Potatoes are ranging around \$4.50 to  
 \$6.00 per barrel in most Eastern markets.

## CLAREMONT POMOLOGICAL

The Claremont Pomological Club  
 was organized in 1802 and is still do-  
 ing business at the old stand. Occas-  
 ionally it breaks away to a new  
 "stand," as was the case on a recent  
 Saturday when the regular May meet-  
 ing was held at the home of V. V.  
 Leroy, Los Angeles. The interest in  
 the transactions of this club was  
 shown by the number which drove in  
 from Claremont and near-by sections  
 to attend this meeting at the home of  
 the secretary who has moved from  
 Claremont where he lived for years.  
 Eighty-three people sat about the  
 "board" and partook of the repast.

Preceding and following the feast  
 was a program which will make more  
 thinking growers and producers of  
 larger crops. The most striking event  
 of the meeting was the address by Dr.  
 C. B. Lipman of the state university  
 because of the novel, almost startling,  
 propositions advanced by him. Dr.  
 Lipman has been making investiga-  
 tions as to soil fertility, and his de-  
 terminations are at wide variance  
 from ordinarily accepted beliefs. It  
 is not for the layman to explain, and  
 we hope to have from Dr. Lipman an  
 outline of his work. In a word, it up-  
 sets completely the theory of spoon-  
 ing out or giving a dose of a chemical  
 which will increase the plant growth,  
 but makes a laboratory of the soil  
 wherein the desired elements are  
 manufactured through the use of  
 stable manures or decaying vegetable  
 matter.

Others making addresses were  
 Messrs. Jas. D. Culbertson and C. C.  
 Chapman, with A. Rae Condit adding  
 interest to the program.

The officers elected for the coming  
 year are: President, C. E. Needham,  
 vice president, E. W. Olds; treasurer,  
 W. O. Fritz; and secretary, V. V.  
 Leroy.

## POTATO INSPECTION

In order to save all possible freight  
 car space a federal inspector will ex-  
 amine all potatoes billed out of Cali-  
 fornia to Seattle or other Northwest  
 points. Formerly all shipments of po-  
 tatoes offered were carried to the  
 Northwest, and if they got by the in-  
 spectors at that end, well and good;  
 if not, the car was held pending order  
 from the shipper, or destroyed as he  
 might direct. This meant serious loss  
 in the use of transportation facilities  
 without adding to the food supply.  
 The inspector will be located at Stock-  
 ton. Tuber moth is the pest feared by  
 the Northern states.

Stockton will ship about 400 cars of  
 onions, largely into the San Fran-  
 cisco market. In fact, the new crop  
 Reds now arriving in San Francisco  
 in boxes and small sack shipments are  
 being stored. There are about 12,000  
 sacks of old stock under refrigeration.  
 Fancy Australian Brown stock is now  
 sold as low as 75 cents.

The order restraining shipments of  
 white beans from California has been  
 rescinded. The notice lifting the em-  
 bargo referred to the fact that 30,000-  
 600 pounds of California white beans,  
 which were necessary for the needs of  
 the war department, have been se-  
 cured.

Raise a freight-saving, year-around  
 garden.

The Choice of  
Those Who Know

Manufacturers and leading mo-  
 tor car distributors recommend  
**ZEROLENE**. The majority of  
 motorists use **ZEROLENE**.

**ZEROLENE** reduces wear and  
 gives more power because it  
 keeps its lubricating body at  
 cylinder heat. Gives less car-  
 bon because, being refined from  
 selected California asphalt-base  
 crude, it burns clean and goes  
 out with exhaust.

**ZEROLENE** is the correct oil  
 for all types of automobile en-  
 gines. It is the correct oil for  
 your automobile. Get our lubri-  
 cation chart showing the cor-  
 rect consistency for your car.

At dealers everywhere and  
 Standard Oil Service Stations.  
**STANDARD OIL COMPANY**  
 (California)

**ZEROLENE**  
 The Standard Oil for Motor Cars

Correct Lubrication for the  
"V"-Type Engine

This, the "V"-Type of au-  
 tomobile engine, like all internal  
 combustion engines, requires  
 an oil that holds its lubricating  
 qualities at cylinder heat, burns  
 clean in the combustion cham-  
 bers and goes out with exhaust.  
 Zerolene fills these require-  
 ments perfectly, because it is  
 correctly refined from selected  
 California asphalt-base crude.

## FRENCHGLOSS

### Is a Finishing Article for Home Use

It is used either with Starch or by itself for soft finish garments.

Its use gives all garments a smooth, pliable, lustrous wearing finish, that will keep fresh and clean from one-third to one-half longer than garments laundered without it.

You will find your ironing much easier and more satisfactory in every way when using FRENCHGLOSS. When used for starched garments you can save three-fourths of the amount of starch ordinarily used, besides having better looking clothes.

You will also find that when garments have once been laundered with FRENCHGLOSS they wash much easier. The reason for this is that FRENCHGLOSS keeps dirt from working into the garments. If you boil your clothes, try dropping a couple of FRENCHGLOSS tablets in the boiler. It will surprise you the good it does.

FRENCHGLOSS is sold on a money-back offer; if not pleased with results your grocer will return your money. Price, 10 cents for a package large enough for six large family washings. By mail, if your grocer does not keep it.

FRENCHGLOSS CO.

1157 E. 12th St.

Oakland, Cal.

## Household Department

### BLACK FRIDAY

Each Friday morning, sharp at eight,  
He watches at the garden gate—  
Our big black cat, so straight and grim  
He minds us, when we look at him,  
Of those tall andirons that grace  
With beauty stern our chimney-place.

As punctual as any clock  
We see him marching down the walk;  
Out to the gate, with footsteps spry  
And long before we hear the cry  
Of "Fish! Fresh fish!" upon the air  
We see Black Friday stationed there.

The reason why, you ask perhaps,  
He thus waits there. 'Tis for the scraps  
Of nice sweet fish saved up for him  
By our fishmonger, jolly Jim;  
Oh, is not ours a favored cat  
To have so kind a friend as that?

No other day does Friday wait  
Out there beside the garden gate.  
How keeps he tally of the day  
That Jim the fishman comes our way?  
Perhaps upon his ebon toes  
He counts the passing days, who knows?

Some method of arithmetic  
Is surely his—some mental trick  
By which the time he calculates  
And sits so patiently and waits  
The day for which he's named, you know—  
A name we think quite apropos.

—Louella C. Poole in Dumb Animals.

### BRING UP THE RESERVES

By Katherine Wicker, United States  
Food Administration

**A**S THIS is being written the world of safety and freedom is at death grips with the enemy. Stern, terrible facts are driving us to action; now the best qualities of the race and breed are seen; whatever happens we shall not fail—to the trumpet call of battle America is rising like a winged Victory.

In this great hour it is necessary that all women live greatly. At the battle front they have performed prodigies of valor and have been decorated with the cross of war for heroism under fire. You, too, would like to drive an ambulance and bring out the wounded under shell fire; but the work behind the lines is even more important. It is not the single act of heroism that will win the fight, but the steady sticking to the job.

Do not be confused; let nothing turn you aside. It is not a new task that you are called to, but the age-old task of feeding the family. Like the tribal women of old, we have sent forth our men-children to war, and we must take up the great first task of feeding for the family. But unlike that tribal woman whose horizon was bounded by the tribal hunting ground, our horizon is the world. Our family, that must be fed, is made up of great nations whose armies, united under a single leader, are facing the enemy. For those women who have eyes to see this is the coming back into a lost kingdom.

This years campaign is a struggle of reserve against reserve; America is the last reserve; in overwhelming numbers our forces are being moved to the front; and behind the lines the women are asked to bring up their last reserves of energy and intelligence in the practical carrying out of food orders.

The food situation must steadily degenerate as long as the war lasts. It is therefore of prime importance to add every item to the total production. No woman with a foot of growing space at her disposal can afford to be merely a destroyer of rations, a dependent on the food supplies of a starving world.

The Allied nations look to America for food. One object of the food administration is to bring as much food as possible under control and distribute these supplies where they are most needed. America is today the careful guardian of the needs of the world. As the food administration anxiously counts the dwindling bushels of wheat, it asks of every woman, "To what extent can you make your home independent of this common store?"

To make the home as independent as possible of the common food pool from which the hungry world must be fed is woman's great task. This one thing you must do; drop every mortal thing and "carry on."

The real work of woman since we entered the war has been conservation. We must hold every position we took last year and go forward to new ground this year. A food survey to determine the year's needs will help. Back up your gardening plan with a cellar and pantry plan.

How many potatoes and how many beans will you need? How many jars of tomatoes and how many of

peaches? Sit down with pencil and paper and make a definite plan, remembering that every woman's real war work is to make the home pantry as independent as possible of the world pantry. Take stock of what you need during the winter and of what you have left on hand. Make an estimate of your grocery orders for the past winter and plan this year to reduce these to a minimum by substituting your own products. For instance for sugar, substitute sorghum syrup and honey if they are available; for candy, homemade crystallized fruits and fruit pastes; for tropical fruits, native fruits; for Brazil nuts, walnuts and hickory nuts; for canned meats, home canned meats; for shipped breadstuffs, neighborhood meals and flours.

To sum it all up — stop eating freight. Transportation is the greatest problem of the war and shipping space the most precious thing in all the world. Above all, don't eat from the pantry of the hungry allies. With a little planning and much hard work you can fill your own pantry with home grown foods.

Before giving up this survey exhaust all home resources, then extend your survey to the neighborhood in a five, ten or 15 mile circuit, according to circumstances, and plan to eat home products.

Last fall one woman who made a survey of a five mile circuit found she could get corn meal, buckwheat, and whole wheat flour from a neighboring mill. She canvassed the farmers and contracted for a winter supply of chickens, ducks, turkeys, guineas, and rabbits, a small quantity of bacon and sausage, and even fresh fish. When neighboring farmers killed a beef she bought a quarter, treated the family to fresh beef and canned and corned the rest. The sugar supply of her family of six she cut down to ten pounds a month and pieced out this allowance with neighborhood sorghum and honey.

During the winter her only call on the overburdened railroad was for a little sugar, coffee, vegetable fats, and seasonings. This was practical conservation. She relieved the railroads of useless transportation, saved the labor of many hands, developed the resources of her own community, and fed her family better than usual.

Patriotism, let us remember, is not the fanfare of trumpets nor the high sound of noble words, but the steady day-by-day work that springs from intelligent insight and a lofty spirit.

Here's a regular, bang-up, man-fashioned over-all that takes to rough play like a duck to water. Easy-breezy, loose-cut overalls that stand for rough treatment—and, like Oliver Twist, come back for more.

Tell mother to get you Boss of the Road Overalls—the kind dad wears. Tell her we make 'em of the toughest, fast-color denim; double-stitched, can't-rip seams; hold-fast, patent buttons; roomy, swinging pockets; reinforced at all points where lively youngsters' clothes first show trouble.

### TO THE POTATO

Written for California Cultivator  
By Ida M. Mowry

O, you dear old spud,  
I love you very dearly  
With your hide incased in mud,  
Which washes off so clearly.

Three times a day I meet you.  
I know you every time.  
With a knowing wink I greet you,  
And with Hoover fall in line.

Every day we eat you,  
Mashed, boiled or fried,  
In a salad or in a stew,  
No matter where you hide.

Potatoes on the table,  
Potatoes everywhere,  
Raise them while we're able,  
And help to win the war.

Irish stew and chicken,  
Scotch and Southern bread,  
Oat meal, too, no kickin'  
For Hoover is at the head.

Potatoes reign as king,  
Let's eat 'em, you and me,  
Then soon we all can sing,  
'Rah, 'rah, for Victory.

Plant 'em, raise 'em, eat 'em,  
Eat 'em every meal,  
'T will help the war to win,  
And make the kaiser squeal.  
—Yours for Victory—"Soldier of the Soil."

### Egg Potato Hash

Chop cold boiled potatoes, one medium sized, one to a person. Boil half as many eggs, as you use potatoes. When hard, mince fine. Place one tablespoon of fat in skillet, add sufficient milk to moisten potatoes well, add potatoes and seasoning, boil till milk is taken up by potatoes. Set back on stove, add eggs, stir with fork. Line dish with lettuce leaves, place potatoes in dish; add minced onion sprinkled over top. A nice toothsome lunch dish.

### Hot Potato Salad

Boil potatoes in jackets till tender, sufficient in number for persons to be served. Peel and mash, add seasoning and cream or milk, beat well. Stir in one or two onions minced fine, place dots of butter over top and serve.

### Cream Potato Gravy

Make cream gravy by usual recipe, then add half cup strained cooked tomato, and half a cup seasoned mashed potato. Serve hot.

## The Cultivator Patterns

8873—Ladies' Corset Cover. Cut in sizes 38, 38, 40, 42 and 44 inches bust measure. The corset cover fastens on each shoulder by means of a tab which buttons over on the front.

8880—Girls' Jumper Dress. Cut in sizes 2, 4, 6, 8 and 10 years. The one-piece skirt with straight lower edge is gathered to the short-waisted jumper.

8859—Boys' Blouse. Cut in sizes 6, 8, 10, 12 and 14 years. The blouse has a simple hem closing at center front.

8640—Ladies' House Dress. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. The waist is in shirtwaist style, and the skirt has three gores.

8862—Ladies' One Piece Apron. Cut in sizes 36, 40 and 44 inches bust measure. The neck of the apron is cut square at the front, and wide straps are joined at the shoulders.

8854—Boys' Dutch Suit. Cut in sizes 2, 4, 6 and 8 years. The straight trousers are buttoned all around to the waist.

8633—Ladies' Two Gored Plaited Skirt. Cut in sizes 26, 28, 30 and 32 inches waist measure. The pleating begins at the side seams and it is shorter at the back.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

## WHEATLESS BREAD, CAKE AND PIE

Recipes for bread, cake and pie made without wheat flour are published by the Sperry Flour Company as supplement No. 3 of the Sperry Cook Book. This may be secured free by writing the Sperry Flour Company, San Francisco. The following pointers on making bread without wheat flour will be extremely valuable. They are taken from this supplement.

### Pointers Concerning Wheatless Breads

In handling doughs and forming into loaves, sprinkle the board and dough with barley flour thus keeping it from sticking. Care should be taken not to make the doughs too stiff.

Bake the bread in pans turned upside down on a piece of tin or the bottom of a large pan. This enables one to make a loaf with a soft crust, and insures a more thorough baking. Use about one and one-half times the usual amount of dough in the pan.

Wheatless breads are best when more than 12 hours old. Cut into thin slices for toast.

Do not expect a light loaf of bread from substitutes. Thus far it is not possible. The loaf will be small and have close texture, but if carefully made, it is nourishing and wholesome.

Do not permit yeast action to continue long as the bread will get sour. Substitutes require no softening of the dough as is necessary with wheat flour.

Using substitutes requires more careful work than does wheat flour, but the wheat saved thereby makes the effort well worth while.

### Wheatless Bread No. 1

One cup cooked and mashed potatoes, one cup milk (lukewarm) one cup water (lukewarm) one yeast cake, two tablespoons sugar, one tablespoon salt, three cups barley flour, one cup corn starch, one cup white Egyptian corn flour.

Dissolve the yeast cake in the lukewarm milk and water, add the sugar and salt, then add barley flour, corn starch and white Egyptian corn flour. Allow this to stand about 20 minutes, then add: Two eggs, one tablespoon baking powder, sufficient barley flour to make a medium stiff dough.

Form into loaves, proof as large as possible, turn upside down on a tin sheet and bake in moderately hot oven 50 minutes to one hour. Slice thin for toast.

### Wheatless Bread No. 2

Two cups flour, one-half cup corn starch, one-third cup White Egyptian corn flour, one cup milk and water (lukewarm) one tablespoon sugar one-half teaspoon salt, one tablespoon shortening, one egg, one yeast cake.

Dissolve the yeast in the lukewarm milk and water, add sugar, salt and egg, then add flours and corn starch, lastly add shortening. Sprinkle well with barley flour on the bread board, fold together and form into loaves. Proof and bake as for Wheatless Bread No. 1. Slice thin for toast.

### Corn Bread and Muffins

One and one-quarter cups yellow corn meal, one-half cup barley flour, one tablespoon baking powder, one-half teaspoon salt, two tablespoons shortening, two tablespoons sugar, one egg (omit if desired) use a little milk instead, one and one-quarter cups milk.

All materials for use in cooking should be measured by level spoon or cup. All dry materials should be sifted before being measured.

Measure the corn meal and barley flour into the mixing bowl, add the baking powder. Make a well and place therein the sugar, egg and salt, add the milk and lastly melted shortening. Spoon into well greased muffin pans and bake in a moderately hot oven.

### HOMINY

Hominy may be used instead wherever a recipe says macaroni, spaghetti or vermicelli.

Use hominy in making muffins and quick breads.

Use hominy as a vegetable for dinner and serve no bread.

### Scalloped with Cheese

Arrange alternate layers of boiled coarse hominy and grated cheese. Pour over all a cup of white sauce, made with corn starch, and bake for 30 minutes. Cooked fish or meat may be used instead of cheese.

## "The store where I do my trading"

THROUGHOUT the West—go where you may—big town, small town, cross-roads store—there you will find Ghirardelli's.

This West-wide distribution has been made necessary by demand—a demand for a delicious, sustaining food-beverage; a demand that is met by Ghirardelli's, and by this alone.

Result? Today Ghirardelli's Ground Chocolate is in daily use in more homes in the West than all other brands combined.

As a beverage it is beneficial; as an aid in baking and cooking it is invaluable.

Be sure to ask for it—at "the store where you do your trading."

In ½ lb., 1 lb. and 3 lb. cans; a tablespoonful—one cent's worth—makes a cup.

D. GHIRARDELLI CO.

Since 1852

San Francisco

## Threefold Co-operation

Every telephone connection requires co-operation. The slightest inattention or indifference on the part of the person who calls, or the company that makes the connection, or the person who is called results in a corresponding deficiency in service. Each is equally responsible for the success of the service.

Not only is it to the advantage of the individual himself to use the telephone efficiently, but his conservation of the advantages of these national lines of speech benefits all telephone users.

Accuracy in calling, prompt-

ness in answering, clear and deliberate talking, courtesy and patience on the part of both user and operator are essentials of service, and must be mutual for good service.

Efficient telephone operation is vital to the war work of this country. The army, the navy and the myriad industries contributing supplies depend on the telephone. It must be ready for instant and universal use. The millions of telephone users are inseparable parts of the Bell System, and all should patriotically contribute to the success of the service.

## The U. C. Poultry School

Written for California Cultivator By Jean A. Koethen

IF ALL the help the agricultural department of the University of California stands ready to extend to farmers and poultry specialists none is more to the point than the school of poultry husbandry which is held in Southern California during each spring vacation by Professor Dougherty. This school was held one year in Riverside and another in Pomona. Last year, just at the beginning of our big June hot wave it met in Van Nuys and was well attended in spite of the heat. This year both time and place were auspicious, for Gardena in the middle of May is an ideal spot, and each day's attendance ran from one to two hundred.

In giving these lectures Professor Dougherty has but one aim—to help poultry producers increase the efficiency of their flocks. To this end there must be more economical feeding, more intelligent culling out of non-producers, a more persistent effort to "breed up," less loss in raising young stock.

One of the most interesting sessions was that in which culling and breeding were discussed. Culling must of necessity precede breeding, for there can be no improvement unless the best layers and most vigorous birds are used as breeders. Constant selection and breeding within your own flock will in time build up a prolific strain without bringing in outside blood if correct principles of selection are employed.

The high producer is of a definite type. As a rule her comb and wattles are large—for her breed, for there is a distinct correlation between size of head appendages and egg production. She must not be too small, but must be as large as she can be without requiring extra food for body maintenance. The more nearly her body, exclusive of head and tail, approaches a parallelogram, the more likely is she to be a high producer. She is a nervous, alert, and always vigorous bird, always a large eater, and her toenails are apt to be worn off by much scratching.

Professor Dougherty laid down these rules for breeding:

Select for vigor.

Breed from good-sized hens, not from pullets.

Breed from the best layers and then line breed.

Breed from late molters.

Breed from sons of high producers.

If a high producing hen is mated to the son of a low producer, the male offspring will inherit from their mothers, the females from their sire. When the males from this mating are mated to the best hens in the flock we may expect in their daughters better layers than the mothers. The daughters of high producing hens are likely to average lower than their mothers, but there will be some exceptional birds. Mating these exceptional birds to the sons of high producers gives a foundation for the high producing strain we are looking for.

At the University Farm hens are culled in July, August or September according to color of shanks and vent, condition of toe nails, color of comb and earlobes and condition of plumage. This is on the principle that the best layers will be shabby in plumage and dull in coloring, while the poor layers will have already molted.

Tuesday afternoon the subject of war rations was discussed, the main point brought out being that we must use what we have but balance the ration. Until recently the dry mash used at Davis consisted of five pounds each of bran, shorts and ground barley; two pounds soy bean meal; three pounds beef scrap; one-half pound charcoal; one-tenth pound salt. This was really a war ration, for there was no wheat in the scratch feed and no corn meal in the mash, but it has now been reduced to a mixture of ground milo and barley, with cocoanut meal instead of soy bean meal. The proportion of beef scrap remains unchanged, for experiments have proved that a mash must contain about seven per cent of some animal meal to secure the best results. A combination of seven per cent beef scrap and 15 per cent linseed or soy bean meal was found to be excellent. Green feed, and cooked vegetables, are very important in helping out the ration. A hen should have all the greens she can consume, not a little once a day.

On Thursday the members of the Gardena Poultry Association acted as hosts to the visitors and served a delicious lunch in the dining room of the high school. To say that their hospitality was appreciated is putting it mildly, for the Gardena women are wonderful cooks, and two hours of lectures, following the ride in the morning fog, had given their guests appetites adequate to the spread.

## Rabbits in Summer

Written for California Cultivator By H. E. Gibson

RABBITS are easily affected by heat, and beginners in the business often lose heavily by not knowing this fact. The writer has known of breeders losing their whole stock in a single day on account of the heat.

In the first place, one should have a good thermometer, and during the extra hot weather watch it carefully, and when the mercury runs up to 95 or 100 degrees Fahrenheit, look after your rabbit stock. There are many little ways in which you can relieve them when suffering with heat, and you must study and think out some plans for yourself which you can adopt to your own particular situation. However, I can offer a few suggestions.

**Shade**

Be sure and locate your hutches in

the shade, under a large tree, or in the shade of a building, or if that is impossible, make some artificial shade to protect your hutches from the direct rays of the sun. Plant vines and have them cover a rough fence of some kind on the south and west side of your hutches, or erect some simple shade covered with canvass or old rugs or anything you may happen to have around that will break the intense heat. Of course, if you can possibly afford it, the best thing to do is to have a double roof 18 inches or more higher than the roof of the hutches. See that they have plenty of fresh air and a bowl of clean, fresh water in their hutches all the time.

**Ground Hutches**

In a very hot climate the best of all

Since  
1902

Coulson Co. Petaluma Cal.

is an underground hutch, but for most countries in the temperate zone we believe, if it can be arranged, the rabbits should be on the ground, and if the ground is sprinkled freely with cold water there will be very little trouble on account of the heat. Of course, one must be careful not to make the ground under the rabbits too wet, as they may catch cold. Put wire netting on the ground so they cannot burrow out of their hutch. The rabbit is primarily a ground animal and will do better on the ground than anywhere, especially the large, heavy variety.

A wet sack put into the hutch will be a great relief to your rabbits suffering with heat. Sometimes during the hottest part of the day you may turn the hose or sprinkler over the hutches and all around them, which will at once bring relief.

### TARIFF CONFERENCE OF POULTRY MEN

The United States Tariff Commission will hold a conference of poultry interests in San Francisco at chamber of commerce rooms on June 25 to discuss with producers, dealers and importers vital questions affecting their business. The information secured by this commission will be placed before congress when it takes up tariff legislation. The commission is out after information on the following lines:

Poultry and egg production in Pacific states: Chief producing regions, their relative importance, poultry and egg production as a regular business in Petaluma distinguished from the by-product character of production that is more general in other sections.

Present condition of the industry and developments since the tariff act of October 3, 1913.

The egg trade of the Pacific states and especially of California—the competitive conditions, distribution, trade channels, markets, prices and the seasonal movement.

Imports: Reason for, character of, and future outlook. Proportion of the imports of shell eggs as well as of the egg products (dried and frozen eggs, egg yolk, egg albumen) that is consumed in California and the proportion shipped East.

Foreign and especially Chinese competition: Character of the competition; probable post-war conditions insofar as this competition is concerned.

Do imported egg products (dried and frozen eggs, yolk of eggs, dried and frozen egg albumen) come into competition with eggs produced on the Coast—in price, quality and uses?

Chinese shell eggs: Methods of preserving and shipping, losses in transit; uses of. To what grade of domestic eggs can they be compared, and are they used for the same purposes as domestic shell eggs?

Adequacy of egg production in California to requirements; the extent to which the state relies upon outside sources for egg supplies; the sources of such supplemental supplies.

Costs of operation in 1918 compared with 1913 and 1914: Land values, labor, feedstuffs and other items of cost specified.

The egg-breaking industry on the Pacific Coast — its status and prospects.

The manner in which words change their meaning has always been interesting. The word pacifist has reversed itself within the observation of a single generation. It now means habitual trouble maker.

## Greater Strength Where Road Strain Comes

See those strong supporting shoulders in the picture below. Those are Ajax Shoulders of Strength. They give Ajax tires more tread on the road.

They are a special patented Ajax feature. They put greater strength where the road strain comes. They mean more miles—no matter what your road conditions are.

### Dirt Track Champions

In 1917, Ajax tires won sweeping victories—237 in all—at state fairs from Texas to Massachusetts. Speed kings of the dirt track—the fellows who must have the best tires—invariably use Ajax.

And, 97 times in 100, Ajax tires are chosen by the individual owner like yourself, to replace some other make that came on his car.

Ajax inner tubes are superior in value and service. Ajax tires and tubes will save you money. Try them.

Write for free booklet—"Ajax Shoulders of Strength."

# Spies and Lies

German agents are everywhere, eager to gather scraps of news about our men, our ships, our munitions. It is still possible to get such information through to Germany, where thousands of these fragments—often individually harmless—are patiently pieced together into a whole which spells death to American soldiers and danger to American homes.

But while the enemy is most industrious in trying to collect information, and his systems elaborate, he is *not* superhuman—indeed he is often very stupid, and would fail to get what he wants were it not deliberately handed to him by the carelessness of loyal Americans.

Do not discuss in public, or with strangers, any news of troop and transport movements, or bits of gossip as to our military preparations, which come into your possession.

Do not permit your friends in service to tell you—or write you—"inside" facts about where they are, what they are doing and seeing.

Do not become a tool of the Hun by passing on the malicious, disheartening rumors which he so eagerly sows. Remember he asks no better service than to have you spread his lies of disasters to our soldiers and sailors, gross scandals in the Red Cross, cruelties, neglect and wholesale executions in our camps, drunkenness and vice in the Expeditionary Force, and other tales certain to disturb American patriots and to bring anxiety and grief to American parents.

And do not wait until you catch someone putting a bomb under a factory. Report the man who spreads pessimistic stories, divulges—or seeks—confidential military information, cries for peace, or belittles our efforts to win the war.

Send the names of such persons, even if they are in uniform, to the Department of Justice, Washington. Give all the details you can, with names of witnesses if possible—show the Hun that we can beat him at his own game of collecting scattered information and putting it to work. The fact that you made the report will not become public.

You are in contact with the enemy *today*, just as truly as if you faced him across No Man's Land. In your hands are two powerful weapons with which to meet him—discretion and vigilance. *Use them.*

## Yolo Fruit Ranch Dry Yard

California's Cured Fruit Production, 1917: 157,500 Tons Raisins; 109,000 Prunes; 38,000 Peaches; 16,000 Apricots; 8,000 Each Apples, Figs; 341,000 Tons All Told.

# National War Savings Day June 28<sup>th</sup>

That's the day we sign up.

That's the day we tell Uncle Sam just how hard we want to win this war. That's the day our government has officially set for us to purchase War Savings Stamps.

On June 28th every man, woman and child in the United States will be called upon to pledge his or her full quota of War Savings Stamp purchases for 1918.

You will be expected to pledge the **full** amount that you can afford—no more—but by the same token, no less.

In every state, county, city, town and village the War Savings Committees are preparing for this big patriotic rally of June 28th. Unless you have already bought War Savings Stamps to the \$1,000 limit, get busy with paper and pencil and figure out the **utmost** you can do.

Remember this. You take no chances when you go the limit on War Savings Stamps. They are the best and safest investment in the world.

They pay you 4% interest compounded quarterly. They can't go below par. You can get back every dollar you put into War Savings Stamps **any time** you need it. You can turn them in at the Post Office **any time** for their full value plus interest.

Uncle Sam is asking hundreds of thousands of men to give their lives to their country. He is asking you only to lend your money.

What are you lending?

## Home Drying of Fruits and Vegetables

**T**HIS is not a learned or extended treatise. Here are only a few hints which may inspire to a bit more of saving, a bit more of efficiency, and much more to our prosperity as individuals. These hints are given by Prof. W. V. Cruess of the University of California. We

may call it "curing," "evaporating," "drying," "desiccating," or "dehydrating," or simply saving food; we are still rendering service in following out these pictorial hints. Dried fruit is hardly the equal of the canned, and certainly not of the fresh, product, but the greater economy, the greater ease of transportation, and the keeping quality make it a most desirable practice.

### Drying Vegetables

**1. Preparation of Vegetables.**—Shell peas; string and cut beans; peel and slice potatoes, carrots, beets, turnips, pumpkins, onions; cut tomatoes in half; husk corn; slice cauliflower and cabbage.

**2. Parboiling.**—Drying is facilitated by dipping in boiling water: pumpkin slices, three minutes; beans, onions, corn, cauliflower, five minutes; cabbage, ten minutes; potatoes, beets, turnips (before peeling) until nearly cooked.

**3. Sulphuring.**—With potatoes, carrots and turnips parboiling may be replaced by sulphuring. Place the prepared vegetables on trays, cover with a tight box under which sulphur is burning for 20 minutes. Peas, peppers, and most greens require neither parboiling nor sulphuring.

**4. Exposure to the sun.**—Place in a sunny place on the trays or on sheets of cloth or paper. Stir or turn once a day. Remove from sun as soon as thoroughly dry. They may also be dried on racks above the kitchen stove. Peas, string beans and spinach will have better color if dried in the shade.

**5. Sterilizing.**—Insect eggs may be deposited on the vegetables, especially in the open air. These can be destroyed by dipping the dried vegetables in boiling water for one minute or heating to 140 degrees Fahrenheit for about two minutes in an oven.

**6. Final drying.**—After sterilizing in boiling water the vegetables should be spread on trays again for a few hours until quite dry again. If insufficiently dry they will mold after packing.

**7. Packing.**—The dried vegetables must be protected from insects and moisture. They may be packed in cans or jars or in paper bags which are placed in boxes or cloth sacks. Examine 48 hours after packing for mold and re-dry if necessary.

### Drying Fruit

**1. Preparation of the fruit.**—Cut in two and pit peaches, apricots, and large plums; cut pears in two; peel and slice apples and quinces; small fruits are dried whole. Many fruits can be dried without further preparation but most are better in color, flavor, and keeping qualities if dipped or sulphured.

**2. Dipping**—French prunes and some grapes are dipped in a boiling solution of five ounces of lye to ten gallons of water for a few seconds and then rinsed. For sugar and Imperial prunes use less lye. Five ounces of lye per ten gallons is approximately two tablespoons per gallon.

**3. Sulphuring.**—The prepared fruit, placed on trays, is sulphured by covering with a tight box and burning sulphur. Apples require about 30 minutes, apricots and peaches three hours; pears and silver prunes a little longer. Dipped fruit does not require sulphuring; Adriatic figs and some grapes are sulphured.

Continued on Page 723

# Agricultural News Notes of the Pacific Coast

## Northern California

Sutter County has formed a woman's land army.

California is shipping a dozen or more cars of cherries daily.

Shasta County is using combined harvesters for the first time.

Cattle men of Mendocino County will meet at Willits June 17.

Roseville, Placer County, farmers are organizing fire fighting units.

Nevada County has its full quota of fire wardens and is fully organized.

Farmers near Roseville are discussing establishing rural telephone service.

Sam Britton of Marysville has been appointed food administrator for Yuba County.

The state employment bureau has opened an office in Redding to supply farm labor.

Sutter County peach growers have formed a canning peach pool through the farm bureau.

Cherry pickers in Green Valley, Solano County, who have been getting \$3.00 a day struck for \$4.00.

Sutter and Yuba County farm bureaus have asked for the closing of saloons during the harvest season.

Paradise, Butte County will have a cannery which Byron O. Clark has been working on for some weeks.

It is reported that the railroad commission is planning development of hydroelectric power along the Feather River.

Hop growers of Northern California, at a recent meeting in Sacramento, protested against prohibition legislation.

Horticultural Commissioner Norton of Sutter County is urging almond growers and others to make a fight on the red spider.

Napa County will prosecute all idlers as vagrants. It will make a clean up of loafers at cigar stores, saloons, and lodging houses.

Sutter County's output of cherries will prove a bumper crop and the long prices are enabling some growers to clean up \$2000 to \$3000 per acre.

El Dorado County farm bureau meetings: Coloma, June 17; Camino, 19; Goldhill, 21; North Side at Kelsey, 25; Placerville, 27; Union 28.

Employees in various Sacramento Valley canneries have taken the oath of allegiance to the United States, and declare they will remain loyal to their flag.

The Sacramento Women's Land Army has applications from more than 100 teachers of the public schools who are willing to do farm work during their summer vacation.

County Horticultural Commissioner Mills of Butte County, after investigating reports that pear blight was extensive in the Paradise region, says that he found little evidence of the disease.

Sutter County Basin Company has borrowed \$5,000,000 on 60,000 acres of Sutter Basin which will be used in reclaiming tule lands. The fees for recording this mortgage in Sutter County were \$40.

Trinity County, with a population of 3000, and not a moving picture within its boundaries, has sent 100 men to war, is producing more food than ever, trebled its \$18,000 Liberty Loan quota, and has a Red Cross chapter of over 1000 members.

## Central California

Rice planting has been completed in the Oakdale district.

Tulare County recently shipped one car of honey worth over \$14,000.

Pajaro Valley reports frost which caught some beans and potatoes.

An Oakdale wool grower recently took in one \$5000 truckload of wool.

Forty-five acres of grain near Modesto were destroyed by fire last week.

Corcoran, Kings County, is estimating a bale to the acre from her Egyptian cotton.

It is reported that more corn is being raised in the Great Valley than ever before.

Fred P. Roullard has been reappointed horticultural commissioner of Fresno County.

Kings County farm bureau has offer of 500 Los Angeles Y. M. C. A. boys for fruit harvest.

A new fruit packing house is being built at Sultana. It will be ready for handling the grape crop.

Cattle men are making protest against the proposed increased area of Sequoia National Park.

Tulare County farmers have complained of high cost of squirrel eradication, which is around \$1.20 per acre.

The California Peach Growers is building a number of packing houses which will be ready for the 1918 crop.

Every one operating a commercial fruit dryer or evaporator must secure license from the food administration at Washington.

County Horticultural Commissioner Beers of Merced County says that the county will have a grain crop fully equal to last year's.

Patterson, Stanislaus County, orchardists have employed women in thinning fruit in their orchards and find them much swifter.

The prevailing cool weather in the San Joaquin Valley has greatly increased the yield of grain. Harvesting is about to begin in the Chowchilla section.

Dried peach producers have met at various points in the valley during the last two days and discussed the matters of production cost and prices for the coming crop.

During the month of May the Stanislaus farm bureau cow testing association tested 1625 cows, 41 of which were placed on the honor role. The best averaged 1.47 pounds per day.

Santa Clara County Farmers Educational and Cooperative Union recently picnicked in Saratoga hills. Addresses were made by professors from University of California and representatives of the department of agriculture.

The state committee on farm labor is taking up the enforcing of anti-vagrancy laws with district attorneys, boards of supervisors, sheriffs, and chiefs of police throughout the state. The committee has also sent a man to the Mexican border to bring in labor.

A rancher in Sacramento County, living along the Cosumne River, reports damage amounting to several hundred dollars from a single ground squirrel who burrowed through the levee on one side of his ranch. Before the hole could be stopped the flood waters broke through, covering several acres already planted to grain.

## Southern California

The citrus experiment station contemplates a summer course in fumigation.

County Bee Inspector Pleasants of Orange County reports one-third of a normal crop.

Practically every section of Southern California has had its train service cut in two.

Burdette Raynor is the new manager of the Hemet-San Jacinto Growers Association.

Hemet, Riverside County, is constructing 18 buildings for housing laborers in the fruit harvest.

Valencia orange growers at Fillmore, Ventura County, have occasionally cleaned up \$6.00 per box.

The foggy and cloudy weather continuing so late has been disconcerting to hay makers who fear rain.

Orange growers of Rialto, San Bernardino County, recently met and discussed citrus culls and by-products factory.

The Hemet Canning Company has set a price of \$50 for Phillips Clings and Tuscans; \$35 for Muirs and Lovells; \$32 for Elbertas.

Riverside apricot growers are about ready for picking. The crop is slightly below normal. Cannerys are reported to be offering \$50 a ton.

Ventura County bean growers are concerned over inroads of aphids in bean fields. The cool moist season has favored their increase.

Potato growers of San Bernardino and Riverside Counties have organized a marketing organization and 120 acres are already signed up.

California Prune and Apricot Growers' Association announces that it will within a few days issue instructions on standardization of pack.

Bee men of San Bernardino County have fixed upon 21 cents as minimum price. That county's honey crop is estimated at 75 per cent of normal.

The busiest section in all California is the cantaloupe packing sheds of Brawley, Imperial County. The southland will ship \$3,000,000 worth of cants.

The horticultural inspector of the Victor Valley district of San Bernardino County reports inspection of 2500 acres of orchards during the past month.

Victor Valley, San Bernardino County, is appealing for an experimental farm, either under direction of the board of public schools or the farm adviser.

Bean growers who were not forehanded are pinched in the enormous increase of bag prices. Some early buyers got as low as a 16 cent price. It is different today.

In economizing on wheat many a housewife is finding that milo flour is a substitute almost as good as the original. The latest favorite, however, is feterita which is almost as white and by some preferred to wheat flour.

Orange County has organized a branch of the California Honey Producers Cooperative Exchange. Temporary directors were elected as follows: George J. Brown, Tustin; W. S. Lee, R. C. McMillan, F. B. Steen, J. R. Lee, all of Santa Ana; B. J. Collins, Garden Grove, and Charles A. Blake, El Toro, alternates.

## The Coast and General

Apple and pear blight made serious inroads in the orchards near Yakima, Washington during 1917.

Cabbage growers of New Mexico are organizing to sell the spring cabbage crop, which will be large.

Shippers of farm products are figuring on the great increase of freight rates which will take place June 25.

Grays Harbor, Washington, is investing its road money in Liberty Bonds and holding back its improvements until another year.

Large grain dealers, one in Kansas City and one in Omaha, have had their licenses temporarily suspended because of food ruling violations.

America imports about 4,000,000,000 pounds of cane sugar yearly, mostly from Cuba. The country produces in raw cane and refined beet 1,873,000,000 pounds.

Disastrous fire in the Klamath national forest, though at first to have originated with disloyal propagandists, is now charged to careless smoker who dumped his pipe ashes.

The United States department of agriculture reports a new strain of asparagus, much larger, more uniform and productive than any other varieties. It is also to an extent rust proof.

Colorado will produce materially less of cantaloupes than for many years. It is now thought the output will not exceed 1000 cars. Over 300 acres have been cut off from Rocky Fords acreage.

A Phoenix cattleman recently shipped a 12 car train of Arizona steers to Kansas City market. The steers averaged 1033 pounds, and the Arizonan returned with a check for \$42,014.12. The fattening of the cattle was done in 60 days on alfalfa only.

Arizona alfalfa growers have found that poisoned bran mash, costing about \$1.00 per acre to distribute, has been exceptionally successful in killing cutworms which were devastating the fields. The poisons used were Paris green and arsenate of lead.

The federal farm loan board reports nearly \$14,000,000 paid out to farmers of the United States during the month of April. The amount paid out at Berkeley was \$569,750. The largest amount paid out by any one district was by Omaha which paid out approximately \$2,000,000. There were two districts which paid out less than did Berkeley, namely Baltimore and Springfield.

Arizona's latest successful crop venture is in spinach. An association of spinach growers has been formed at Glendale, and several cars were sent this season to Kansas City and Chicago. It was marketed in bushel baskets, each basket containing about 16 pounds. It netted the growers from 85 cents to \$1.14 per bushel, and the average yield was around 300 bushels per acre.

The federal government has notified Holland that if she wishes American wheat she must send some of the vessels she is keeping within her harbors in her own country. She wishes America to deliver the wheat in the ships which were seized from Holland in American harbors some months ago. More than 400,000 tons of Dutch shipping is lying idle in Dutch ports, and 15,000 tons of cereals are now at American ports ready for Holland.

# Home Canning of Fruits and Vegetables

CALIFORNIA never canned and dried and conserved fruit and vegetables as in 1917. In 1918 another record will be made.

"What, when and how?" is coming continually. Here are some hints from a leaflet on Canning Fruits and Vegetables issued by College of Agricultural, University of California.

In commercial output of canned goods no state equals California. Supplementing this great output, home canners during the past two years have aided materially in the state's welfare and, more, in adding to the

world's food production. One most satisfying point connected with this food conservation is that it utilizes a product which would be almost entirely waste.

The University of California has rendered invaluable service to the state and to fruit and vegetable growers in investigation and in the issuing of information in leaflets, circular and bulletin form. We are glad to pass the word along and also to suggest to the growers that they should at all times avail themselves of the University publications. Incidentally, file this and all other copies of the California Cultivator.

## Canning Fruits

**1. Preparation of the fruit.**—Wash, sort and prepare the fruit as for cooking. Remove peel, cores, and pits; cut or slice as desired. Cook as soon as possible after cutting. To prevent darkening, cut apples and pears should be kept in water until cooked.

**2. Heating and cooking with sugar.**—Place the prepared fruit in a pot and then add dry sugar, one-quarter to one-half pound per pound of fruit, or with very sweet fruit none. Add a cup of water and heat gently, to avoid scorching. Heat to scalding temperature. Do not cook till soft.

**3. Filling the jars.**—Warm the jars with hot water, and ladle the hot fruit into them through a funnel until they are filled to within one-quarter inch of the top. Avoid getting juice on the outside. The neck should be dry and clean.

**4. Placing rubbers and covers.**—Test clean, scalded rubbers by bending and stretching. They should not crack. Put evenly in place on the necks of the jar, then apply the covers, placing or screwing them loosely, and lower the jars into the sterilizer.

**5. Sterilizing in a wash-boiler.**—Place a piece of wire screening or other false bottom in the bottom of the boiler and pour in a few inches of hot water around the jars. Apply the cover to the boiler. Unless the cover fits very well place a cloth beneath it. Heat until steam comes from beneath the cover and then for about 20 minutes longer.

**6. Removal from the boiler.**—Remove immediately. Handles on the wire screen bottom or wire baskets to hold the jars facilitate removal. A cloth or a wire jar lifter may be used. The lifter in the illustration is made for holding washing and serves well for lifting jars and as a false bottom. Place hot jars on wood or paper to avoid cracking.

**7. Tightening the covers.**—Tighten the covers immediately and stand the jars upside down. This insures the sterilization of the covers. Leaky jars can be detected by air bubbles entering during cooling.

## Canning Vegetables

**1. Preparation of the vegetables.**—Shell peas, string and break green beans, husk corn, remove tops of beets, turnips and carrots, cut asparagus into lengths to fit the jar and in general remove waste parts and prepare as for cooking.

**2. Scalding (Blanching.)**—Place the prepared vegetables in a cheesecloth bag or wire basket and immerse in boiling water: corn on the cob, peas, beans and asparagus, five minutes; tomatoes, one-third minute; beets, 15 minutes. Other vegetables, three to five minutes.

**3. Chilling.**—While still hot and as quickly as possible plunge into clean cold water for a few seconds and allow to drain for a minute. The colder the water the better.

**4. Packing.**—Pack the dipped vegetables immediately while still hot in cans or jars. Jars should be heated before filling. Beets and tomatoes are peeled and corn cut from the cob before packing.

**5. Preparation of brine.**—Dissolve three ounces (three level tablespoons) of salt in one gallon of water and add five ounces (a small jelly glass) of lemon juice; corn requires eight ounces. Tomatoes are acid and require none. Strong vinegar may be used instead of lemon juice.

A glass measuring cup should be used to measure the lemon juice. If only one quart of brine is to be made up add two level teaspoons of salt and two and one-half tablespoons of lemon

juice to a quart of water. Use twice this amount of lemon juice for corn. The lemon juice may also be used by filling the jar of packed vegetables

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

The photograph on the cover of this issue depicts one of many thousand scenes all over California at fruit curing time. California's cured fruit crop surprised itself and all the rest of the world last year, and still more surprising was the fact that these cured fruits were no sooner offered on the market than they were sold and at most satisfactory prices. This year's output may not be any greater than that of last year, but from present indications it will command longer prices and quicker sale.

## TARIFF CONFERENCE

California producers are planning to attend and make known the needs of their industries before the tariff commission which will sit in Los Angeles, June 17, 18; Fresno, June 20; San Francisco, June 25.

## NITRATE ON THE COAST

The Cultivator has often given information as to the distribution of nitrate of soda from various of the South Atlantic ports. We believe several ship loads have been delivered to the southeastern section of the country; none has been as yet distributed through government agencies west of the Mississippi.

We took the matter up with Washington and have from Chief of the Bureau of Markets, Charles J. Brand: "We are trying to make arrangements

for the distribution of nitrate of soda in California from a Pacific port. We are communicating with proper parties in California but are not able to advise you definitely as to the arrangements which will be made."

## COST TOO MUCH

We want lower priced wheat substitutes. Patriotic people are saving willingly. Many a family is going without wheat in any form, and more are using only a small portion of wheat, but all are more or less rebellious at the unjust prices of the substitutes.

## WAR SAVINGS

California is in line for the war savings drive June 28. There were mass meetings held in every precinct in some sections last Tuesday. Pledges will soon be in circulation which will give everyone in the state opportunity

## WARNING AGAINST A GERMAN PEACE

### From Platform Adopted by League to Enforce Peace

And, apprehensive of the lure of an inconclusive peace, which would enable the present masters of Germany to continue their dominion of Central Europe and sooner or later to menace again the peace and freedom of the world, the league feels that our people should be forewarned, in case Germany should propose to make peace on terms that might well deceive the unsuspecting. Suppose she should offer to retire from Belgium and France; to cede the Trentino to Italy; even to relinquish all claims to her captured colonies, and to promise some kind of autonomy to the various races of Central and Eastern Europe. Such an offer would be highly seductive, and if we are not prepared to understand what it means might well beguile the Allies into a peace which would be delusive; because unless the principle of militarism is destroyed, the promises would be kept no better than those broken in the past. Autonomy of other races would mean their organization for the strengthening of Germany until she had control of the resources of a population of two hundred millions for her next war; and the abandonment of her former colonies would be made only with the hope of recoupment in South America on a more favorable occasion. Such a settlement would be a mere truce pending a strife more fierce hereafter. So long as predatory militarism is not wholly destroyed no lasting peace can be made.

to pledge the purchasing of war savings stamps monthly, weekly or at any particular dates to December 31, 1918. Two billions are to be raised. Shell Berlin with W. S. S. from California.

## USE MOTOR TRUCKS

A striking example of the use of motor trucks in the East and of the immense saving to shippers can be had from these figures: If the shippers now using motor trucks as carriers between New York and Philadelphia were sending their tonnage, which amounts to 900,000 tons annually, over the railroads instead of the highways, the recent freight rate increase of the railroads would tax them approximately \$450,000 more than they paid previously. Motor trucks plying between these two points carry the equivalent of 720 box cars loaded to 50,000 pounds capacity, or, 36,000,000 pounds each week. Six hundred and forty trucks operating between these two cities make a total of 7200 trips a week.

## ENTERING THE MARKET

The last Live Stock and Meat Trade News issued by the bureau of markets of the department of agriculture remarks regarding a dispatch from Kansas City:

"Shipments of live stock from California have ceased to be a rarity at this market. During the first five months of 1917 shipments from California consisted chiefly of hogs, horses and mules. These same species have been arriving in very limited numbers during the same period in 1918, while there has been a decided increase in cattle and sheep. Only 29 California cattle arrived on this market in March, 1917, while 1177 arrived in May."

Perhaps California will yet get return for some of the good fruit growers' money which has in past years been sent East for the products of Eastern packers. Meanwhile let's have more California packing houses and ship instead the cured product.

## PRODUCING MORE

Farm bureaus of California have aided materially in the increased production campaign. Especially have these bureaus centered on the "hog on every ranch" endeavor, and nearly every county reports the increase of hundreds of hogs through the placing of one little pig on fruit or other ranches where hogs are not produced in a large commercial way. Much of this fat and meat production will be at only nominal expense, for, while feed bought in small quantities has been exceedingly high, there is often a mass of cull fruit or other waste products which may be saved in the

form of pork. On other little ranches a few sheep, an additional cow, more poultry, or occasionally even a baby beef, are all adding to the production. All of which makes possible more war savings stamps, more food for more of the Sammies on the way to Berlin

## A BILLION BUSHELS

America stands between civilization and the murderous Hun. Failure to send our troops to France and, even more, failure to send food to sustain our soldiers and those of our Allies—in fact practically all the people of the Allied nations—would soon end the war, and at best with our increased shipping and increased planting of cereals there is a wonderfully narrow margin. Hence it is with great satisfaction that the people watch the reports of the weather bureau and market bureaus of the department of agriculture, which indicate conditions favorable to a bumper crop.

Over five million acres of winter wheat were abandoned to other crops because of winter killing, but the planting of spring wheat was correspondingly increased, and favorable spring conditions have brought on the winter wheat so that it is now estimated we may possibly produce a record crop, but if not, one which will at least approach one billion bushels. The favorable spring has also favored corn, and America will produce food as never before in her history. The crop of winter wheat alone it is estimated will approximate six hundred million bushels.

And best of all the American people are in such an attitude of service that conservation of every grain possible of this great crop will increase the amount available for use.

## This Week's War Notes

The lists of names of American boys killed in action are increasing in length day by day.

Careful estimates indicate that at least 60 per cent of German submarine vessels have been sunk.

Lightning struck a 55,000 barrel tank of oil near Santa Barbara which was filled to capacity; it was totally destroyed.

Ex-President Wm. H. Taft says: "We must go to Russia and make an Eastern front." "No task is too great for the United States."

A court-martial at San Antonio, Texas, imposed a 45 year sentence on each of 45 "conscientious objectors" who refused to don the uniform.

Deserters from the Austrian army, surrendering themselves to the Italians, bring information that the Austrians are massing additional forces for another drive at Italy.

Nearly the entire force of the Baker Iron Works, Los Angeles, is out on strike this week. Federal Mediator Connell is negotiating between employes and owners.

The Russian embassy at Washington has appealed to this government and to the other Allies to send expeditionary force to Russia to repel German invaders.

Practically all shipping activities have been resumed along the Atlantic Coast, but it is known that the submarines are still within striking distance. The total sinkings from these raids is 18.

The Shipping Board has let contracts for 40 concrete ships of 7500 tons. Eight ships will be built in each of five separate yards. One of these yards is at San Pedro and another at San Francisco.

Secretary Baker has stated; "More than 700,000 American soldiers have gone over seas to carry back to France the encouragement and assistance which Lafayette and Rochambeau brought to America."

The "Petrograd Bolshevik" announces that it is the intention of the Soviet administration to recognize the independence of "The Southern Chinese Republic" and that it will proceed to organize councils of Chinese workingmen similar to the Bolshevik councils in Russia.

Chairman Hurley of the Shipping Board declares that by 1920 the United States will have 25,000,000 dead weight tons of shipping, which will involve an expenditure of \$5,000,000,000 but will give America the greatest merchant marine in the world. This year's output will be about 3,000,000 tons.

The Turks have confiscated property to the value of five billions belonging to Greeks. Greeks of Thrace are being forced into the Turk army and Greek women are being sold as common chattels. More than 500,000 Greeks have been deported, many of whom have died from torture or starvation.

The Women's Land Army in England has succeeded in planting many thousands of acres to potatoes. Many thousand tons of tinned meats and other foods have been landed in the past few weeks and England's food situation has been vastly bettered. Rationing continues and every ounce of food is saved.

Inch by inch the Germans are drawing nearer to Paris; day by day the resistance increases; and while General Foch is willing to yield territory in order to save men, his resistance is stiffening and counter attacks have reclaimed several miles of territory. German troops are suffering appalling losses and their plunge is renewed without consideration of cost in men. There has been less activity on the Marne and the extreme southern end of the line, likewise little apparent interest in Flanders excepting as the British are bringing more pressure to bear. The main drive is in the center or Montdidier section and directly toward Paris. Yankee troops are now landing at the rate of a quarter of a million a month.

### CANNING VEGETABLES

Continued from Page 721  
with hot water and adding two tea-

spoons of lemon juice to a pint jar and four to a quart, with salt to flavor. Sterilize as above.

6. Heating and filling with brine. — Heat the brine to boiling and pour over the vegetables in the jars. If the jars are hot and a funnel used there is little danger of breakage. Apply rubbers and loose covers as with fruit and place in sterilizer. Pack tomatoes without brine.

7. Sterilize in a wash-boiler. — Sterilize as described for fruit, but leave corn two hours, beans one and one-half hours and other vegetables one hour after steam issues from the boiler. Remove, tighten covers and allow to cool in an inverted position as with fruit.

### Drying Fruit

Continued from Page 719

4. Exposing to the sun. —The treated fruit is spread in thin layers on trays and exposed in a sunny place. Turning the fruit hastens drying. When finished it should be soft and leathery, neither brittle nor juicy. In very hot weather the product is better if the trays are piled one on another in "stacks" when about two-thirds dry. The final drying thus takes place in the shade.

5. Sweating.—Most fruits do not dry evenly. Sorting out and redrying the slowly drying pieces is sometimes necessary. Packing the dried fruit tightly in large boxes, bins or piles ("sweating") for some days will equalize the moisture.

6. Sterilizing and packing. — Dipping in boiling water, drying and packing in tight containers as is done with vegetables will protect the dried fruit from insects. If the fruit is very dry, drain after dipping and pack without re-drying.

Late in the season when the weather is rainy, and in localities with summer rains, fruits must be dried by artificial heat. A dryer can be made on plan of sulphur box shown in step "3." Make a box with gable roof and large enough to hold a dozen trays and a small stove. The roof must be equipped with a large ventilator to facilitate removal of vapors. A kitchen dryer can be made of several coarse galvanized screen trays, 18x24 inches, suspended one above the other over the kitchen stove.

She also serves who stoops and weeds.

### CHANGES IN STATE COMMISSION

The weekly news letter of the state horticultural commissioner announces the resignation of D. C. Fessenden as secretary and that Avery S. Hoyt, formerly in charge of the Los Angeles office, has been appointed to fill the vacancy. The letter states that Mr. Fessenden leaves to take up private work.

D. B. Mackey, field deputy, has been transferred to the southern portion of the state and O. W. Newman has been appointed to fill his position. J. N. French is made field assistant of rodent control for northern coast districts.

## GARDNERS UNIT BEAN HARVESTER

THE illustration of a Two Unit Gardners Bean Harvester shows the most Modern Bean Harvester manufactured at any price. It cuts operating cost fully 60 per cent. Cuts four rows and requires only one man and two horses to operate.

By gently rolling the vines outside the harvester at least ten per cent of the beans are saved.

No trouble to remove knives for sharpening or replacing.

Remember prices positively will advance after July 1st, 1918, so don't wait—order now.

Get information from your implement dealer or write for new folder to

## PUMPS

Let Us Tell You All About

## KIMBALL'S

Direct Flow Turbine

Save Digging Pits and Large Wells

The Kimball Direct Flow Turbine is a moderate speed rotative pump employing an improved design of Impeller and Rectifier not embodied in any other pump. This, coupled with low velocity, reduces the friction to a minimum thus saving horsepower and reducing wear. All bearings are lubricated through a hollow shafting by a positive lubricating system. These bearings are protected by automatic water tight packing glands to prevent sand entering.

### Look at This!

A Kimball Direct Flow Turbine will pump:  
40 miners inches out of a 7 inch well.  
115 miners inches out of a 10 inch well.  
200 miners inches out of a 12 inch well.

Write us your irrigation requirements. NO CHARGE FOR ESTIMATES. Our many years of experience in irrigating systems places us in a position to help you save if you will give us an opportunity.

## Topping and Pinching Vines

The state experiment station is sending out new bulletins with a fund of information which will induce many California producers to write for them. They may be had for the asking. Write Agricultural Experiment Station, Berkeley. Number 296 has to do with Topping and Pinching Vines (grape vines). The bulletin No. 296 is written by Prof. Frederic T. Bioletti and Prof. F. C. H. Flossfeder. From the conclusions we quote: **Conclusions**

We may conclude from these results that both pinching and topping are harmful under conditions similar to those under which the experiments were conducted.

That very heavy topping continued year after year may almost ruin a vineyard.

That topping is more harmful than pinching but that even the latter, contrary to the usual belief, is both weakening and detrimental to the crop.

It should not be overlooked, that these conclusions apply only to the conditions of the experiments.

Many varieties, when growing in excessively rich soil abundantly supplied with nitrogen, humus, and water, are often unfruitful owing to an excess of vigor, and moderate summer pruning might result in better crops

without dangerously weakening the vines.

Some varieties, moreover, produce few fruit buds on the main canes but produce them abundantly on the laterals. Moderate pinching or even topping in such cases might be necessary to promote the growth of fruitful laterals.

Topping or, better, pinching, is also necessary under some conditions

where heavy winds are liable to break off whole shoots. It should be done, however, with a realization that the only object in view is to prevent a more serious injury.

Probably four-fifths of the topping practiced in California is inadvisable. It should never be applied to Muscats or similar vines of weak growth nor to any variety when not excessively vigorous. It is less harmful to young vines than old and is most useful for two and three-year-old vines to get them into the proper shape before they bear.

## Valuable Report Blank

California has been especially lax in the matter of dependable statistics as to her own productions. For years we have succeeded in making fairly close approximations and guesses. The state board of agriculture is now improving its statistical department. The county horticultural commissioners with the aid of the assessors' books have gathered some information which is reported and tabulated by the state horticultural commission. This work is being gradually improved, and we have just been permitted to see the method of one of the counties in gathering these statistics together. This was in the office of Wm.

Wood, horticultural commissioner of Los Angeles County. Mr. Kent and Miss Kenilworth have both taken a great interest in securing information which is often requested as to the county resources. The means of making this quickly available has not been at hand so Mr. Kent has devised a monthly crop report. It is so simple that explanation is not necessary. This simplicity is one of its valuable features. It consists of a long narrow sheet with a blank for each month of the year, with special rulings providing columns for "oranges in bearing," "Navel acs.," "Per cent.," "Val. acs.," "Per cent.," "Seed. acs.,"

"Per cent.," and the same number of columns for nonbearing oranges. Then there are lemons, grapefruit, apples, apricots, in all columns for 42 different fruits and soil products. The column showing the acreage in the district or in the county, as the case may be, along side the column showing percentage or condition of the crop makes it possible to determine almost instantly the total of any one crop.

These monthly reports are made out by various inspectors and handed in promptly at the end of every month.

### ONE CENT A MILE FARE FOR FARM LABOR

A meeting of California fruit growers holding term contracts with canners and packers was held recently in the assembly room of the Chamber of commerce at Fresno. H. P. Stabler of Yuba City was elected chairman.

Shortage of labor in the agricultural districts was discussed and in view of the importance of this matter in relation to the fruit growers, the following resolution was adopted. Fruit growers throughout the state whose crops are menaced by a shortage of labor are requested to pass a similar resolution and send it to the California Development Board, Ferry Building, San Francisco:

"We, the fruit growers of California holding term contracts with canners and packers, assembled at Fresno, April 27, 1918, do represent that we are growing an important food product which is menaced by the shortage and high price of farm labor; that the possibility of quickly moving farm labor from points where a surplus may exist to points where labor may be scarce would greatly facilitate the conservation of food; therefore

"Resolved, that we urge the food administration to use its good offices in securing a one cent a mile railroad fare for farm labor for the season of 1918-1919."

### FIXING PRUNE PRICES

Definite information regarding prices of prunes for 1918 will soon be given out by a commission of ten appointed by Food Commissioner Merritt. Prices will be made on a basis of production cost. Regarding the commission the San Jose Mercury says:

"The independent grower will be represented on the commission by Elmer E. Chase, E. N. Richmond and W. S. Clayton, all of San Jose; E. L. Fellows of Campbell, for the Santa Clara Valley; Mr. Sims of Visalia, for the San Joaquin Valley; Frank Buck, Vacaville; Jerry Buckley, Cottonwood; W. H. Williamson, Mills, for Sacramento County, and W. C. Chisholm, Santa Rosa, for Sonoma County. All are large prune growers.

"H. G. Coykendall of San Jose, manager of the California Prune and Apricot Growers' Association, Inc., will act for the association and will have an equal voice in fixing the price with the nine independent growers.

"Merritt has called a meeting of representatives of the independent growers for Friday afternoon in the food administration offices in San Francisco to discuss details in determining a fair price. It is expected that a price will be agreed upon within two weeks."

### LATER FRUITS

Vacaville reports fruits about ten days later than last year. Continued cool weather has caused delayed ripening. A fruit handler reports:

"The cool weather has been bad for our crops. I believe, however, if we have a period of ten or 15 hot days soon we will be able to catch up with the other sections in time for the peaches.

"California's fruit crop will be only about 60 per cent of what it was last year, while the peach crop in the Southern States and the Middle West is abnormally heavy. We must have some hot weather soon if we are to compete for early Eastern shipments."

Food Administrator Merritt has requested county horticultural commissioners to gather fruit growers and shippers together in order to determine fair prices for fruits during the coming season. The growers are asked to decide as to the minimum price to

## Builders of Prosperity

The great irrigation project adds to the country's wealth by making arid land fruitful. The "Caterpillar" Tractor achieves a similar result by providing cheaper, more efficient power for cultivation. Both are builders of prosperity.

Cheaper, more efficient power means bigger profits, less work, less worry. The "Caterpillar" Tractor excels in this respect because of correct design, correct construction, correct choice of materials, backed by thirty-five years' manufacturing experience. These make the "Caterpillar" Tractor a most profitable investment.

Let us send you complete information about this Tractor. A post card request will bring it.

be accepted for dried fruit, and from information received the food administrator will set a maximum price.

### AUSTRALIAN APPLES

The Australasian Fruit World is calling attention to the fact that the United States is taking advantage of the Australian market for apples, but suggests that Australia return the favor by shipping to this country its fall apples which are ripening at our springtime. A writer in this paper discusses the freight difficulty and calls attention to American business methods in meeting them. He says: "Australia has a population of under five million people. We produce ample quantities of fruit for this population, and we assure a regular supply to local consumers by the assistance of cool storage. Each year in the months of October, November and December some hundreds of thousands of cases of American apples reach Sydney, Brisbane and Melbourne, and being fresh off the trees (only six weeks), well graded and packed, beat us on our own markets by shillings per case, viz., 12/6 to 25/-, against 7/- to 10/- for our stored fruit. We are in exactly the same position to supply America with fresh fruit when they can take it, as they are to supply us; but we have the added advantage that where they, in supplying us are limited to five millions of people, we, in supplying them, would have 100 millions to work on, so that it seems to me that if five million people, living under practically the same conditions in regard to good wages and living conditions, etc., as the 100 million, can consume 300,000 cases at profitable prices, how much can the 100 million consume?—1,500,000 cases?"

"Cool stored fruit will never compete with fresh picked stuff, and if we met the American demand for high grade pack, etc., we need have nothing to fear on the score of quality."

### COST OF PRODUCING APPLES IN YAKIMA VALLEY, WASHINGTON

To determine the annual cost of apple production per box, and to gather such information as to different methods of orchard management practiced by the growers of the Yakima Valley, Washington, as might have a bearing upon cost of production, specialists of the United States department of agriculture in the summer of 1915 conducted a detailed study of 120 representative orchards in that section. Their findings have been published in Department Bulletin No. 614, which is the fourth of a series of bulletins on the cost of apple production in four of the leading fruit growing valleys of the Northwest.

### PRICES FOR FRUIT HANDLING

The Placer County farm bureau has established the following schedule for labor employed in that section:

Packing: Cherries, 12 rows and under 15 cents; 13 rows and over, 18 cents; plums, flat rate, six cents per box; peaches, flat rate, three cents per box; pears, flat rate, seven cents per box. Farm labor per hour, 30 cents. This scale was established by the farm bureau committee and it is urged that all abide by it. The committee will meet frequently and revise the schedule if determined advisable.

### SUMMER COURSES

The University of California will hold two summer sessions this year, each extending from June 24 to August 3. The one, which will be the 19th annual, will be held at the University of California, covering the six weeks with a full program including many attractive agricultural courses. The southern division will hold its sessions in the new Los Angeles high school. It is under the direction of Mrs. Davenport Martin.

The federal government of Australia has agreed to make advance payment on evaporated fruits on delivery at Hobart. A charge of six per cent will be made on money so advanced, inspector's certificate and shipping documents being retained by the government. Because of the shortage of shipping and delay in securing bills of lading it has been recommended to the government that advances should be made on evaporated fruit as soon as it has been stored for shipment.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Liver Trouble

Will you please tell me what remedy to use when your chickens have liver trouble. I lose a great many laying hens, their combs turn black, and they only live a few days.

More green feed, more exercise, an occasional dose of Epsom salts and less beef scrap in the mash are the remedies for liver trouble, because bad livers always come from heavy feeding and lack of greens and exercise. I am taking it for granted that your diagnosis of the disease is correct. When hens die very suddenly without previous signs of illness, there is always a question whether they may not have been poisoned by putrid meat or moldy feed. Look to your feeding, give all the greens the hens will consume, and make sure they are not getting anything that could cause ptomaine poisoning. To give Epsom salts, mix the salts—half a teaspoon for each hen in the flock,—with a small quantity of wet mash. Such a dose might be given once a week for a month or until the hens seem to be in good condition.—J. A. K.

### Household Insects

Is there anything I can burn in a clothes closet that will kill moths: both the common and the silver fish moth?—Subscriber, Escondido.

The best procedure is to capture as many of the moths as possible. However, if the closets and rooms are tight enough fumigation is very effective, but to secure best results the room should be almost air tight. Before proceeding stuff rags and paper in every crevice. The use of burning sulphur is not as satisfactory as other fumigants. It is also objectionable in its effect on colored fabrics. The

use of hydrocyanic acid gas, in exactly the same way as method used by the citrus orchardists to control scale, is perhaps the most effective, and the gas is not explosive. It is however deadly to humans as well as insects, so that care must be taken to generate the gas after one has left the room, and then air the room several hours before entering. The time for fumigation for one room is usually four hours. The gas is generated by the use of cyanide of sodium one ounce, sulphuric acid 1½ fluid ounces, water two fluid ounces. Mix acid and water; then when all is ready drop into the vessel the cyanide. Carbon bisulphide is also a good fumigant. It is likewise deadly for humans to breathe and also is very explosive. Keep all fire removed when it is used. Regarding the method of handling cyanide in buildings we refer to extended article on page 246 California Cultivator, September 11, 1913.

### Budding Over Peaches

Is it practical to bud over peach trees from five to eight years old which have been mixed in an orchard eight years old? The old trees are in good condition but are poor varieties. Is it practical to bud over scattering trees that are eight years old that have grown up with old trees? Trees are in good condition but want a different variety. Have too many of this kind and want to replace the old trees with young trees. What age trees are best to bud? Is budding of trees which are in bearing satisfactory?—Subscriber, San Bernardino.

The difficulties in the budding of stone fruits have usually prevented the making of bearing orchards. It is possible to graft these trees over but practically every expert handling it says it is impossible. The age of the tree best to bud is one year from seed.

## Lime Sulphur Best for Citrus Thrips

**P**LAIN lime sulphur solution applied in three successive sprays will enable a satisfactory control of the citrus thrips, an insect which is rapidly becoming a menace to the production of oranges, grapefruit and lemons in California and Arizona. This treatment has been developed in investigations by entomologists of the United States department of agriculture, and is believed to be the most reliable of four satisfactory mixtures tried; lime sulphur, sulphur soda, lime sulphur and tobacco extract, and tobacco extract. In a publication of the department of agriculture, Bulletin 616, "The Citrus Thrips," J. R. Horton of the bureau of entomology describes the citrus thrips in this country, its life history and control, and announces the results of extensive experiments in spraying. It is explained that the lime sulphur solution recommended may be either one to 56 of the 36 degree Baume density, or one to 50 of the 33 degree Baume density.

Maps presented in the publication mentioned show the distribution of the citrus thrips in California and Arizona, to which states the insect is

confined, it is believed. The insect is known to occur in eight counties in California: Sacramento, Fresno, Tulare, Kern, Los Angeles, San Bernardino, Riverside, and Orange. The infestation is most serious in Tulare, Fresno, Riverside, and San Bernardino. In Kern County the insect is increasing rapidly, and with larger plantings doubtless will be quite as injurious as in Tulare County, the writer of the publication believes.

The most important damage caused by thrips is the lowering of the market value of fruit by unsightly scabbing and scarring. The eating quality of the orange is not affected by this damage, but its commercial grading is lowered considerably and the selling price correspondingly reduced. The loss suffered from grade reduction due to thrips in the Lindsay district of the San Joaquin Valley in a season of comparatively light infestation is given in the bulletin as follows: 43 per cent, or 255,742 boxes, reduced to second grade at a loss of 37 per cent a box, making \$96,744.54; 23 per cent reduced to third grade at a loss of 65 per cent a box, making an additional \$88,914.18, or a total loss of \$183,539.34.

## Florida Orange Crop

In regard to the coming crop of Florida oranges Edgar Wright, editor of The Florida Grower, writes:

"No one would hazard a guess as to the total of the coming crop or how much the exchange might be expected to handle. Two million boxes is a mark that has been shot at before, but never hit. Some are optimistic enough to hope that it will be reached

this coming season. Estimates have been asked of all sub-exchange and association managers, but it is probably too early for good guesses as to the total crop. Probably at the annual meeting of the exchange, which will be held on June 6, some estimate may be arrived at, though possible second-bloom will have to be taken into consideration, even then, and this bloom

### A Size for Every Engine and Motor

Piston rings prevent escape of gas and power. They must fit exactly or there is compression leakage, excessive carbon, and power loss. The scientific construction of

**McQUAY-NORRIS**

**LEAK-PROOF PISTON RINGS**

assures equal pressure all around the cylinder walls. They are made in all sizes to fit every model and type of engine, automobile, tractor, etc.—every size accurately gauged to fit the particular model of motor.

Your local dealer or garage has—or can get—our data book of piston ring sizes of practically every engine and motor made. This will tell exactly what rings you need. Complete size assortments are carried by more than 300 jobbing and supply houses all over the country from which you can be quickly supplied. Over 2,000 unusual sizes and oversizes—all widths and diameters—are kept constantly on hand at the factory ready for prompt shipment anywhere.

**McQUAY-NORRIS Superoyl RINGS**

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in lower grooves to insure maximum compression and fuel economy.

### THE BRENNIS EXTRA HEAVY Orchard Tractor Cultivator

Our 1918 orchard tractor cultivator is built to meet the demand of the owners of medium and small tractors for an extra strong cultivator that can be handled by the tractor driver. This cultivator is made on the same lines and with the same high grade steel as our well known chisel cultivator but without the hand levers and rear wheel. It has the hand wheel screw lift making it a perfect one man all steel tool. We make a medium weight for small tractors and an extra heavy cultivator for the larger tractors and in four sizes 5, 6, 7, 8 and 10 feet wide.

is sometimes heavy, especially on trees that have had a light February bloom. All directors have faith that the price for this year will not be lower than \$2.00 a box on the tree to the grower, and plans will be made to let the most isolated growers know this. Certainly that will be the price if all the growers say so. Jobbers are ready to pay it, and so are retailers and consumers, though of course they will take the fruit for less if it is offered them. Sales Manager Skelly repeated his statement that conditions were just as good as last year; that California had a light Valencia crop, and would be cleaned up early, and that Florida could not possibly ship any more fruit before Christmas than was shipped last year. The country is prosperous, and the consuming public has the money and will not be backward about paying an average of 40 cents a dozen for oranges, and that they will have to pay that whether the grower gets \$2.00 or whether he gets less, and so he might just as well get it. Speculators will try to buy cheaper of course, but they will make just as much money for themselves at \$2.00 as they would at \$1.00, the difference going into the pocket of the retailer. Just hold out for that \$2.00, and you will get it just as sure as fate; that is providing you all hold for that figure. Just spread the gospel and get your neighbor to demand what the fruit is worth.

In regard to this, President Ross says: "Particularly grapefruit trees show a remarkable disinclination to function this year, and the orange crop is not going to be particularly large, though it is conceded that it will be larger than last year, in some districts 100 per cent larger, but it is well to remember that in these sections they had very little fruit this past season. It is well to carry away from this office a spirit of optimism and to spread it around. It is a shame that any speculator is able to buy fruit at \$1.00 a box on the tree. The grower cannot produce fruit for that money now that the price of everything has gone so high. The conditions that gave us the phenomenal prices this year, and which were something of a surprise, are just as good now and will be just as good next fall as when we started to ship our crop last season."

#### VOSLER BACK

E. J. Vosler, formerly secretary of the state horticultural commission, has returned from five months in Australia where he has been investigating as to parasites which control the beet leaf hopper, *Eutettix tenella*, also other insects of agricultural interest. Large shipments of the material were sent to California, most of them arriving in good condition, but the rearing of the parasites from the leaf-hopper eggs has presented almost insurmountable difficulties. A sufficient quantity will be obtained however, to ascertain whether or not they will breed on the eggs of *Eutettix tenella*.

In addition, Mr. Vosler brought a lady bird and other insect enemies of mealy bug, black scale, etc. The lady bird is *Mydrias pygmaeus* and known to feed freely on young mealy bugs.

#### LOSS IN DRYING

Yields of various fruits and vegetables per ton fresh material.

Material	Yield per ton pounds	Moisture content of dry product, per cent
Apples, white stock varieties	250-260	35
Apples, dark stock varieties	260-285	35
Apricots, halves	350-400	26
Peaches, halves	225-250	22
Pears, quarters	270-300	24
Cherries	400-450	24
Blackberries	380-400	18
Raspberries, Cuthbert or Shaffer	400	18
Raspberries, Gregg or Ohio	440-475	18
Loganberries	340-370	18-20
Prunes	600-675	22
Green corn	480-520	15-17
Green beans	275-325	16-18
Green peas	400-475	15-18
Tomatoes	150-200	15
Potatoes, white	475-525	16-18
Potatoes, sweet	575-650	17-19
Carrots	275-320	16-18
Beets, garden	300-320	17-20
Beets, sugar	340-400	17-20
Parsnips	250-300	16-18
Cabbage	240-275	17-20
Onions	240-300	16-20
Pumpkin	250-325	18-20
Grape Raisins	400-600	20-30

#### MEALY BUG CONTROL

Regarding control of mealy bug through use of parasitic and predaceous insects County Horticultural Commissioner Brock of Ventura writes:

"I have just returned from the field and we have been able to find a large number of larvae feeding on mealy bug at the present time. If it is possible for the branch insectary to furnish us with some of these valuable predators at the rate they have been furnishing them for the past month I haven't the slightest doubt but that we can clear up one of the worst infestations we have had in a number of years in a grove on which we are staking our efforts. In addition to the large colonies liberated in this particular grove other smaller colonies were furnished which were liberated in groves slightly infested. We hope and believe that within the next two or three months, at the present rate of liberating these valuable insects the grove on which we are now working will be commercially clean. I sincerely hope that the many other duties will not prevent the state commission pressing this work with the same vim it has been given in the past."

#### GLENN COUNTY FARM BUREAU

Farm Adviser W. H. Heileman sends schedule of June meetings: Orland, 17-18, night meeting 18; Crome, 19, night meeting, 19; Jacinto, 20-21, night meeting, 21. Directors' meeting at Willows at 10 a. m., 22. Farm Home Department meeting at Willows at 10 a. m., 22; Willows, 24-25, night meeting, 25; Grapevine, 26, night meeting, 26; Elk Creek, 27, day meeting 2 p. m.; Plaza, 28, night meeting, 28.

During the month meetings will be held at Hamilton, Fruto and Clarks Valley for the purpose of organizing fire fighting districts.

Directors' meeting for the month in the Sacramento Valley districts are as follows:

Colusa County, 17; Sutter County, 18; Butte County, 19; Shasta County, 20; Tehama County, 21; Glenn County, 22.

#### LOS ANGELES COUNTY FARM BUREAU

June meetings of local centers of the Los Angeles County farm bureau are scheduled at Lamanda Park, 17; San Dimas, 18; Artesia, 19; Covina, 22; Burbank, 24; Little Rock, 25; Monrovia, 25; Lancaster, 26; Newhall, 27; Owensmouth, 27; Pomona, 28; Inglewood, 28; July meetings at Glendora, 1; Clearwater, 1; Claremont, 2; Moneta, 2; Whittier, 3.

The Claremont-La Verne Center meeting date has been changed from

the fourth Friday in the month to the first Tuesday. The next meeting is at Claremont, July 2.

#### GREAT CONVENTION WEEK

November 11-16 inclusive will be convention week at Riverside. The start of the conventions will be on Monday morning, and something will be doing from that time until Saturday night. The county horticultural commissioners will be the first on the grounds. The California Association

of Nurserymen will also meet in Riverside the same week. It had been hoped that state horticultural commissioners of all Western states might meet in Riverside the same week, but this is as yet uncertain. The one biggest event of the week is the state convention of California fruit growers.

Farmers of Newman, Stanislaus County, have filed request with the town council asking for the closing of the saloon.

## Four Row Bean Cultivator

For Tractor or Teams

Killefer Quality

**Conserve man power—One man cultivates four rows of beans as easily as two with this tool.**

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the lighter tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the four rows and the foot control is very easy on the driver.

Built to cultivate any width row from 20 inches to 36 inches wide.

**Specify Width Rows When Ordering**

**The Killefer Manufacturing Co.**

2209-21 Santa Fe Ave.

Los Angeles, Cal.

## Farm for Profit

**and Help U. S. Win the War**

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## HAUSER PACKING COMPANY

9th and Mateo Sts. **PHONE** 10336-Bdwy, 5600 Los Angeles, Cal.

## SURFACE IRRIGATION

## Protecting Stored Food From Insects

By E. R. de Ong

Trouble is coming to our flour, cereals and dried fruits if we don't kill the bugs and worms. Warm weather is bringing them out of their hiding places to breed and lay eggs on every sack of flour and meal, every exposed raisin, and even on the cheese and ham. And now is the time of year to hit them and hit them hard. Don't wait until your stock becomes wormy before you fight the bugs, but do it now, before they have a chance to lay eggs everywhere. So let's overhaul the storeroom and within the next ten days remove those broken packages of oatmeal, crackers and mushes, the samples of grain and those returned sacks of flour, that someone thought were "buggy." Decide right off if any of this stock is sufficiently webby and infested to be unfit for human consumption. If it is, take it right out of the store. If any of the stock needs rebolting arrange at once to send it to the mill. Don't let it stay in the store for it is in these old accumulations that may lie undisturbed for months that the moths and beetles harbor, waiting their chance to lay eggs on fresh stocks as soon as they come in.

A wormy package of goods is unsalable, you do not even want it to go to your customers to reflect on your store, the factory will not take it, so it is your loss and the way to avoid that loss is to prevent any eggs from being laid on your stock. And if in-

sects are present you cannot protect your stock from their attack unless it is sealed in a tight package; cloth sacks will not do it and the cracks in a wooden box allow newly hatched worms to pass through readily, so it becomes necessary to fight the insects.

Hunt up all the wormy packages, dump the contents and burn or steam all the boxes or sacks in which they were stored, remove all the trash, papers or packing in which bugs can hide.

Clean the waste box thoroughly and see that no worms are hiding in the cracks.

Sweep the room—floor, walls and ceiling—a good job of sweeping is one of the most important parts of the work—if necessary repile the stock so that no place is left untouched.

Whitewash either with a brush or spray pump, and leave no point untouched. Use enough material to whiten the walls, but not thick enough to peel off readily; if necessary cover the stock while whitewashing, but don't neglect this part of the cleanup. A small barrel spray pump with a long line of hose is quicker and will get the whitewash into the cracks better than if a brush is used. A half barrel mounted on a truck makes a good container for the wash and can be moved about readily and thus reach every part of the building.

Do it now.

## Potato Drying

There is one thing which we hope the present food situation will bring about, and that is that there may be factories for the making of starch, potato flour, or at least ordinary dried potatoes from some of our surplus.

Years like the present it is impossible for the grower to secure fair returns for his investment. He has a perishable product which will not permit of exceptionally long storage. This has at times resulted in losses which have practically ruined some potato growers. European countries have long cared for this waste and made an extremely valuable product and saved the growers. We note in the Humboldt Beacon a description of method of drying potatoes in a Humboldt County factory which is under direction of Farm Adviser Christian-

sen.

Machinery for drying the potatoes was installed the latter part of April in the Central Creamery and on May 5 operation commenced.

Two shifts of women and men are employed, the day crew consisting of 38 people, principally women and girls while on the night shift 28 hands are busy.

From \$17 to \$25 is paid per ton for the potatoes, quality determining the price with spoilt and poor potatoes checked back to the seller.

The tubers after being hoisted in sacks onto the upper floor are poured into a circular container, which revolving rapidly removes much of the skin, through the potato coming in contact with the container, a stream of cold water constantly playing upon the potatoes during the process.

The spuds then drop through a chute onto tables on the lower floor, around which 15 or 20 women and girls stand with knives removing the last vestige of skin. Next in order

comes the slicing process, done by machinery, the pieces of potatoes then falling into a long tank containing clean, cold water.

From this tank the slices are taken and placed in wire-woven containers and then dipped in boiling water where they remain but a few minutes. Then upstairs into the spreading room where at a long table women, girls and men quickly spread the slices on wire-meshed trays.

From the spreading table it is but a step to the drying compartments, in which the potatoes remain for from 12 to 15 hours at a temperature not under 120 degrees Fahrenheit or over 150 degrees.

Upon being taken from the dryer the slices are poured into tin containers and afterwards boxed for shipment.

Wednesday's run was the best made thus far, the crew forking up 140 sacks of potatoes, averaging 115 pounds to the sack.

Inasmuch as the contract for the 30 tons ordered by the war department must be filled by June 1, Farm Adviser Christiansen has found it necessary to at times work the women employees overtime, securing permission to do so from Governor Stephens in view of the work being a "war emergency measure."

Quartermaster Southgate from Fort Mason made the plant an official visit recently and following a careful inspection pronounced the output as remarkably good.

As it requires six and two-fifths pounds of potatoes to produce one pound of dried potatoes 384,000 pounds or 192 tons are needed to fill the government order for 30 tons. If an average of \$22 is paid a ton for the spuds, and that is a fair average, the growers will realize \$4,224 for the tubers required for this one order.

## University Graduate Writes of Experience at the Front

Thomas G. Chamberlain, a graduate of the University of California of the class of 1915 and now a second lieutenant in the Coast Artillery Reserve Corps in active service with the American Expeditionary Forces in France, has written of his experiences at the front:

"Our trip across the Atlantic was not without incident, and as a result it was recorded that one of the kaiser's submarines should forever remain a submarine.

"After landing we had an unfortunate experience with gas which cost us eight men. Since then, we have moved from place to place, and have seen France and her people. A fine country.—A great people!

"Six weeks I spent at an anti-aircraft artillery school. The school was held in one of these old palaces built by Louis XIV. With its beautiful paintings and statues and tapestries, its large gardens and lawns and lakes, its underground passages and

wine cellars (now dry), it made a very picturesque place for a school.

"After the school I had a trip to the front. For two weeks I lived at an anti-aircraft battery quite close to the line. I saw much firing; had my baptism of fire; visited the front line trenches; fired a machine gun; saw some thrilling fights between planes; and took a long ride in a plane.

"All officers visiting the front have to write a report on their observations for the general staff. So when I returned, I had plenty to do for a time. From a law-note to an artillery report is quite a jump.

"Several times I have visited Paris, and it is certainly a wonderful city. My visits there have been enlivened by the air-raids and the firing of the long range guns.

"At last my battery is in the field and we are 'doing our bit' in what is, without doubt, the greatest battle ever fought. In the language of the pollu, 'ils ne passeront pas?'"

#### SORGHUM SYRUP

The state has long been asking for information as to the production of sorghum syrup. The agricultural station is meeting this demand in Circular No. 198, "Syrup From Sweet Sorghum," by W. V. Cruess. It refers to the value of the sorghums in the manufacture of silage only incidentally and gives explicit information regarding crushing of the cane and manufacture of the syrup. Illustrations are given showing details of evaporators, skimmers, finished construction, and other appliances needed in syrup manufacture. As to returns from sorghum production the circular approximates as follows:

Yield of 14 tons per acre, equal to 12 tons stripped cane.

Yield of 11 gallons of syrup per ton of stripped cane (or 132 gallons per acre).

A season of 30 working days.

That factory has an average capacity of 160 gallons to 170 gallons per day or about 5000 gallons for the season. This would represent about 40 acres of sorghum.

#### BEE PASTURE IN SANTA CRUZ

Farm Adviser Washburn of Santa Cruz County, with Prof. Coleman, bee specialist of the state university, have just concluded a survey of Santa Cruz County. They found that the country is abundantly supplied with both honey and pollen plants blooming in succession throughout the year. The mountains are covered with manzanita, wild lilac, coffee berry, poison oak, maple, and laurel with wild alfalfa or deer weed on all the open hills and good sage range upon the sand hills. For apiary sites there are many warm, protected nooks in the canyons and on the hills, with an abundant water supply.

While not more than a hundred colonies of bees are to be found in the county at the present time, it is estimated, very conservatively, that the bee pastures here will easily support 10,000 colonies or more. Ten thousand colonies would produce over 2,000,000 pounds of honey every year which is now going to waste.

#### WATCH YOUR FIREWORKS

Believers in the old-fashioned Fourth must watch their steps this year because of the regulations of the federal explosives law. The small boy may still have in his possession toy paper caps, sparklers, serpents, Chinese fire crackers, etc., "costing not more than ten cents per package." Fire crackers of larger size may be sold singly but none over five inches long by three-fourths inch in diameter. Every retailer of fireworks must secure a federal license. The United States explosives inspector for California is John H. Griffin, Madera.

#### FIRE PROTECTION

The agricultural experiment station of the college of agriculture is issuing Bulletin 295, "Fire Protection for Grain Fields, With Special Reference to Fire Protection Appliances for Grain-Harvesting Machinery." It is by Woodbridge Metcalf. From it we quote the following six rules:

Six Rules for Prevention of Fire in Grain Fields

Rule One—Keep your machinery in repair, well lubricated and provided

with an air clarifier and a good spark arrester. Hot boxes and hot carbon cause 30 per cent of grain fires.

Rule Two—Always have at hand on the harvester at least two good chemical fire extinguishers. They keep little fires from "growing up."

Rule Three—Don't smoke in the fields. Tobacco may be satisfying, but it's "hot."

Rule Four—Break up big fields by

cutting hay strips at intervals while grain is green. These give you a chance to fight and confine fire to a small area.

Rule Five—Plow several furrows around your grain field as a fire break. Your neighbor may not be as careful as you are.

Rule Six—Help organize your community and install fire fighting equipment at convenient points. Get ready now. After a fire starts it's too late.

## To Prevent Kernel Smut of Sorghum

The sorghums, kafirs and related plants are frequently attacked by a fungus which causes the destruction of the kernel. This is known as kernel smut. The infected grains are somewhat enlarged as compared with the normal, and upon examination will be found to consist of a very large number of small brownish particles. These are the spores of the fungus which have been developed in the kernel.

The sorghums and kafirs seem most susceptible to the disease. The milos are practically free from the smut.

The injury comes in the destruction of the kernel. Frequently five to 15 per cent of the heads in the field may be smutted. This amounts to an important decrease in the yield of grain. In experiments carried on at Columbia, by the University of Missouri college of agriculture, the amount of smut produced in various varieties has been from 30 to 60 per cent.

The smut spores are distributed on the sound seed of the sorghum. When the seed is planted and germinates, the smut spore also germinates and produces the fungus. When the plant develops to maturity, the smut fungus produces its spores in the developing seed of the sorghum and its spores will be distributed upon the sound grain planted the following season.

Since the disease is carried on the seed, seed treatment is an effective remedy. It is sufficient to immerse the seed for a few minutes in a solution of formaldehyde and water. The solution used is one pint or pound of formalin, or 40 per cent formaldehyde, in 30 gallons of water. Instead of immersing, the seed may be sprinkled with this solution. After this it should be covered for a few hours. Then the seed may be spread out to dry.

Since a certain amount of this smut is commonly found in the field, it is advisable to treat the seed

#### CLEAN UP, PAINT UP

Owing to the great number of school boys who will aid in farm work this year an organization has been formed, with St. Louis as headquarters, which is termed the National Clean Up and Paint Up Campaign Bureau. The bureau states as a reason for its existence:

Two hundred and fifty thousand boys will be placed on the farms of the country during the coming season. In justice to these boys and as a guarantee to the communities to which the boys will return at the close of the summer season, the state council and the state director of the Boys' Working Reserve must see that the boys are placed only on such farms as will afford wholesome housing facilities. All studies that have been made of farm housing conditions point to the fact that farm housing conditions are startlingly unsatisfactory at the present time. Health authorities have often called attention to the very large proportion of typhoid fever in the cities of the United States which is caused by the return of individuals from the farms or country villages at the close of the summer season. The investigation of the housing conditions on farms to which boys are to be assigned by the Boys' Working Reserve and the state council is clearly a question for which the state council and director of the Boys' Working Reserve are alone responsible.

# LET THE MONEY IT SAVES PAY FOR THIS ELEVATOR.

BY its use, the saving in sacks, the saving in time and the saving in labor will soon pay for this equipment and it will continue to serve you for years to come.

## JOHN DEERE TUBULAR STEEL ELEVATOR

It handles all small grains—wheat, oats, rye, barley, shelled corn, flax, rice. It has big capacity—it elevates 15 to 20 bushels per minute—handles the biggest load in six to eight minutes time. This big capacity is secured at comparatively low elevator speed.

It serves you when marketing your grain, as well as when harvesting it—elevates from the wagon into tanks, granaries or cars—elevates from tanks or storage bins into wagons. Operated by either engine or horses, its purchase ordinarily does not result in extra expense for power. A team of horses or a 2½ H. P. engine or larger will operate it.

The hopper, of big capacity, can be folded up out of the way when the load is driven up. Lower the hopper and the elevator is ready for duty. Backing the wagon is unnecessary. Hopper is provided with an adjustable feed by which the volume of grain being elevated is accurately controlled—you can quickly adapt the elevator to the power you apply.

Built of steel almost entirely, it will not warp or decay. The elevator proper is made of 3/8 in. steel well-casing, 6½ in. in diameter. It will never wear out. Round steel flights run smoothly inside of casing. The heavy elevating chain is fastened to center of flight. Grain cannot get under chain or into sprockets—no grinding, cracking or spilling of grain.

Shafts which operate in self-aligning bearing cannot get out of line and cause heavy draft and breakage.

Portable outfit furnished for big ranches where quick transportation is required. Because of the many years it will serve you and its extremely low maintenance cost, the John Deere is decidedly the most economical elevator to purchase. It is a real solution of your grain handling problem.

Don't wait until too late to get a John Deere Elevator—see your John Deere dealer at once—get extra value by getting the best—the John Deere.

John Deere elevators are carried in stock by John Deere Houses at Portland, Spokane, Seattle, Boise and San Francisco.

## Fourth Holstein Sale at Sacramento

Written for California Cultivator By C. A. Briggs

ON JUNE 5 and 6 at the State Fair Grounds in Sacramento the California Breeders' Sales and Pedigree Company held their fourth sale of pure bred registered Holstein cattle consigned by A. W. Morris & Son Corporation, Woodland; McAlister & Son, Chino; Henderson Company, Sacramento; J. S. Gibson Company, Williams; Buena Alta Herd, Oakland; Pacific States Corporation, Tulare; Bonita Stock Farm, Lodi; Gotschall & Magruder, Ripon; Rosamaines Rancho, Riverside. One hundred and twenty-three head were sold for a total of \$41,890, an average of \$340.57.

The sale was managed by Charles L. Hughes of Sacramento with Col. Ben A. Rhoades of Los Angeles acting as auctioneer. Col. "Cy" Clark of Modesto and Harold Rhoades worked in the sales ring. Owing to a combination of adverse conditions, the especially fine offering of splendid animals went for very low prices when quality and production records are taken into consideration. Prospects of labor difficulty and prevailing high prices of feed kept many buyers away, and bargains were the order of both days sales. The sellers took their medicine with grim smiles and good humor for "the buyers day" means the wide scattering of good blood and a future demand for pure stock at better prices. The "topper" was a splendid young bull from the A. W. Morris & Sons' herd, Segis Pontiac Abbecker, a 34 pound son of a 32 pound sire whose dam, dam's dam, and sire's dam average 32.91 pounds of butter in seven days. After spirited competition he was sold to R. C. Sturgeon of Tulare, a young breeder just coming into prominence as a buyer of the right kind of foundation animals. It is predicted that he is going to be a factor in still further putting Tulare County on the map as a leading Holstein center. He paid \$3200 for the privilege of putting this fine bull at the head of his rapidly growing herd. Next highest in price was Ontario Blonde Pietje from McAlister's Chino herd. She has just made a four year old seven day record of 30.07 pounds of butter with an average test of 4.08. She sold to the veteran breeder, E. J. Weldon of Sacramento for \$1700. V. L. Heath in charge of the Napa State Hospital herd was a strong bidder for good ones for his own foundation herd which he is starting on his new farm in Napa County. Another large new buyer was the Leeman Dairy of Sacramento.

Detailed statement of sales by consignments follows:

## APPLETON Silo Filler

## New models

save you every way.

Here's the best value in a silo filler ever offered you. We say this from 47 years farm machinery manufacturing. We know that the new Appleton, with its important new features, will prove the biggest labor-saving, time-saving and money-saving machine you ever bought. Built on the same quality basis as all the Appletons—the same tremendously strong, everlasting frame and trouble-proof construction; big capacity and light running qualities that make the Appleton always *outdo* and *outlast* other silo fillers. Sizes for 6 h.p. and up. Don't wait until you are ready to order. Write today for

## Field Notes from the Live Stock Men

So successful was the National Milk and Dairy Farm Exposition at Grand Central Palace, New York, the week of May 20 that immediate steps were taken to hold the show again next year. Dr. Charles E. North, managing director of the exposition, announced that the next show will be held during the week of March 10, 1919. This exposition was staged not with the idea of making money but primarily to educate the people in the food value of milk and to bring about a better understanding of various situations for the dairymen. "That it has accomplished its purpose is best attested by the fact that there is a new feeling among the dairymen, farmers and public regarding the dairy situation," stated Dr. North, who was loud in his praises for the exhibitors, who laid aside all commercial interest to bring forth the educational factors of the milk subject.

Canary Paladin Vale 84403, pure bred Holstein matron, on her twelfth

Canary Paladin Vale and Calves

birthday presented her owner with twin heifer calves. She then proceeded to roll up a world's record for both butter and milk production in both the seven and 30 day divisions. She produced 810.3 pounds of milk in seven days, yielding 35.22 pounds of butter and in 30 days she produced 3100.2 pounds of milk yielding 131.31 pounds of butter.

Canary Paladin Vale's sire is Brightest Canary 37170 and her dam is Paladin Vale 76331. Her twin heifer calves are by King Pontiac Pelham De Kol. She is owned by a York state breeder, J. W. Vaughan.

Ideaze Pontiac Lass 238652 is the 33d pure bred Holstein cow to produce more than 40 pounds of butter in a week. Her official record for seven days stands at 715.5 pounds of milk, yielding 42.48 pounds of butter. She then continued and completed a 30 day record of 2811 pounds of milk yielding 141.08 pounds of butter.

J. W. Jamison of Los Angeles, and Taft, is starting an extensive herd of pure bred Hampshires. He has vast interests in Taft and Fellows.

Wm. Bernstein of Hanford, has an extra fine junior yearling Poland-China boar and some wonderful show prospects in the under year classes. His futurity pigs are splendid, and he intends to make the entire Pacific fair circuit.

C. J. Gilbert of Lancaster, Los Angeles County, has a very fine herd of Hampshires, and his pigs by Duke's Allen are certainly far above the average.

Donald Graham of Lancaster, has a splendid herd of Durocs. He recently purchased a wonderful show prospect, a junior yearling sow, from Ed Faust of Ohio. She farrowed ten extra fine pigs. Mr. Graham will exhibit a full herd this fall as well as one or two carloads of fat barrows.

The Southern California Duroc-Jersey Swine Breeders' Association will join together and show a carload of pure bred fat barrows, as well as their own individual herds, at the California Liberty Show.

The George Junior Republic school of Chino, will have a fine exhibit of Duroc-Jerseys at the fairs this fall.

The Llano Vista Rancho of Perris, has a great lay-out of breeding and show stuff. They are fitting a full herd for the various fairs this fall, along with two carloads of fat barrows for the California Liberty Fair. F. A. Langdon, the manager of the ranch, is superintendent of the swine department at the Southern California Fair to be held at Riverside.

The White Breeders' Companion beginning with the July, 1918 issue will be known as "The Chester White Journal." The change has been deemed advisable because the words "White Breeders' Companion," do not

signify the purpose of the paper nearly so well as the words, "The Chester White Journal."

O K L Albina 267383 has broken the record for fat production in the senior two year class of the division covering tests begun not less than 240 days from freshening by producing in seven consecutive days, 465 pounds milk containing 17.78 pounds fat. She freshened at the age of two wears, 11 months, three days, and began her test eight months after freshening. Her prior record, begun 40 days from freshening, is 482.7 pounds milk containing 18.92 pounds fat. Her sire is Ormsby Korndyke Lad 102469; her dam is Valley Farm Albina Cornucopia. She was bred by Ezra Holbert, Lake, New York; and is now owned by Julius Schmid, Montgomery, New York. In the senior two-year class of the eight months division, she displaces Miss Valley Mead De Kol Walker 250936, whose record begun 240 days from freshening is 404.2 pounds milk containing 17.066 pounds fat. Computed on the 80 per cent basis, the equivalent butter claimed for O K L Albina amounts to 22.22 pounds.

### FAT STEER SALE

Following the plan used in other counties in California in marketing fat hogs, the Monterey County farm bureau will institute a fat steer sale at San Ardo, Monterey County on June 15.

The farm bureau through Farm Advisor T. C. Mayhew has been in touch with the various meat packing establishments throughout the state who have signified their willingness to send representatives to the sale.

Arrangements have been completed for conducting the sale by Sales Manager J. H. Aniotzbehere. The stock will be graded and placed in pens and will be offered for sale to the highest

bidder. The farm bureau will charge one per cent commission on all sales to cover the expense of the sale. There will be about ten car loads of fat cattle for sale at that time and place.

This is the first sale of fat cattle exclusively which has been held in the state.

### MORE SILO CAMPAIGN

The Practical Farmer, Philadelphia, backing up the Indiana silo campaign, says the following editorially:

"Our first year of the war under modern conditions has taught us many things and shown us how things could be done which we believed before were impossible. Indiana is now planning to have erected 10,000 new silos within her boundaries this year. This number, according to previous rate of increase, could not possibly be built this year, but by launching a state campaign or a 'drive,' as we have come to call such efforts, more than likely the number will not only be attained but surpassed. Each county has been allotted, according to its dairy and stock interests, the number of silos it is counted on to have erected, and each of the 91 county agents in the state have their county and township silo organizations to see that the plans are carried out. The slogan adopted for the campaign is 'If you can't put a gun on your shoulder, put a silo on your farm.' Surely every previous argument in favor of silos is still good today and additional reasons exist why there should be a silo on every farm where live stock is kept. Don't say you have invested all your money in Liberty Bonds and can't afford it. Go to your banker with the bonds as security for a loan to pay for the silo. The money then will cost you not more than two per cent, and you won't have to be bothered hunting an endorser for a note—Uncle Sam's note will satisfy the bank. Look into this plan the next time you are in town."

### MUTTON SHEEP NOW LEADING

Sheep raising primarily for mutton production and secondarily for wool is steadily advancing in this country. At the present time 45 per cent of the sheep belong to those of the mutton blood, 35 per cent to those of fine wool, and 20 per cent to the cross-breeds. Ten years ago the mutton sheep were 35 per cent of all sheep, fine wool sheep 41 per cent, and cross-breeds 24 per cent, and consequently,

during this period, one-tenth of the national flock has changed from wool to mutton as the chief purpose. While mutton sheep have thus increased their percentage of all sheep by ten during as many years, fine wool sheep have lost 6 1/2 from this percentage and the cross-breeds 3 1/2.

The so-called half-and-half system is the most common in use and the most satisfactory in renting dairy farms in representative dairy regions near Chicago studied by farm management specialists of the United States department of agriculture. Generally speaking, under this system the landlord supplies the land, the tenant the labor, and each shares the expenses and income equally. The study was made on 143 farms in Green County, Wisconsin, and Kane County (the Elgin district) Illinois, where dairying is a comparatively old, well developed and profitable industry. In the report of the study, published as Bulletin 603 of the department, it is brought out that while this system is particularly applicable to the regions studied, it is believed to be suitable in dairy sections generally.

### THE JERSEY

"Her product is of the very highest quality, obtained on the most economic basis, and commands the best prices in the market. The grain of her rich, golden butter is natural, and not broken down by artificial coloring matter."

## Breed Leaders

Every breed of livestock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the livestock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pieterje Bloom of the University Farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

Written for California Cultivator By C. A. Briggs

### JOHNSON'S DEFENDER

THE renowned Defender, grand champion at the International, was any better than his descendant. Johnson's Defender, owned by F. M. Johnson of Napa, then he was a

smoothness and mellowness is immediately noted by hog judges both amateur and professional. The ring judge at the California state fair, 1917 recognized his worth and outstanding quality by pinning the junior champion and reserve grand cham-

Johnson's Defender

dandy, for Johnson's Defender is some boar. As an individual he is nearly a perfect specimen of the Duroc-Jersey breed with the true high arched back and great spring of ribs indicating heart and lung capacity. He is good in shoulders and hams, is deep and wide with a typey head set firm and well on the shoulders; he is wide between the eyes, has good ears and stands well on his feet. His remarkable

pion on him. J. R. Conway of Westfield, Iowa, has the honor of breeding him. He was sired by Conway's Defender who was a son of Defender, a boar that has sold twice for \$5000. His dam was Choice Belle, a splendid animal. She was sired by Fancy Crimson Wonder who was one of the largest of the Crimson Wonders. He comes of royal blood and is a credit to his breeding.

### Up to Us

From Address by Food Administrator Hoover at the National Milk and Dairy Farm Exposition at New York.

AM very glad to have this opportunity of meeting the representatives of an important section of the dairy industry. I wish to take advantage of this opportunity to discuss with you the world situation of the dairy industry and the service that the dairymen of this country are morally drafted to fulfill.

If you could stand in the middle of Germany today and survey the land to the borders of Europe you would discover its whole population of 400,000,000 human beings short of food. Where Germany has overrun its borders millions of people in Poland, Finland, Serbia, Armenia and Russia are actually dying of starvation and other millions are suffering from under-nutrition. Still others of these millions outside the German lines, that is, our Allies and neutrals, are living on the barest margins that will support life and strength.

This, the most appalling and dreadful thing that has come to humanity since the dawn of civilization, is to me the outstanding creation of German militarism. Yet the Germans themselves are not the worst sufferers. They are extorting at the cannon's mouth the harvests and cattle of the people they have overrun, leaving them in desolation. I am convinced that if the war were to cease tomorrow the toll of actual dead from starvation and its attendant diseases within the German lines would double or treble the 5,000,000 or 6,000,000 of men who have been actually killed by Germany and her allies in arms. The 10,000,000 people in occupied Belgium and Northern France would have died of starvation had it not been for the

action of the nations at war with Germany in the maintenance of these people of a pitiable relief. But this is only one part of the whole story of misery, for the sinking of the world's shipping is reverberating privation in some direction into every corner of the globe.

Of all the food industries of Europe, there is none which has been so stricken by the war as the dairy produce. The human race through scores of thousands of years has developed a total dependency upon cattle for the rearing of its young. No greater catastrophe can happen to a people than the loss of its dairy herds, for the total loss of dairy produce means the ultimate extinction of a people. The German people supported their herds by the import of feed stuffs from their neighbors. This being cut off by war, their produce in meat and milk would have fallen to a low ebb indeed had they not supported themselves to a considerable degree by stealing the cattle of the populations they have overrun. I have had Polish and Serbian cattle in German pastures pointed out to me with pride by German officers. I witnessed for years the stealing of Belgian and French cattle. In Belgium alone the herd diminished from 1,800,000 to 700,000 in three months of German occupation. At that point the protests of the relief commission held it in check. But in Northern France absolutely all of the cattle were taken before the relief commission arrived. The French men had been drafted out of this region and there was therefore an undue proportion of women and children. There were, in fact, over 800,000 children under 12 years

## Elliott-Brant Rancho Guernseys

We have an especially fine bunch of young Guernsey bull calves to choose a future herd sire from. Guernsey bulls cross well with all breeds of cattle and they increase the quality and color of the milk as well as the quantity of milk and butter fat. The Guernsey bull has won the battle with the scrub cow.

We have calves from A. R. cows with different sized records up to 750 pounds of butter fat. Our prices are reasonable and are based on breeding and records. Write and tell us your needs and we will tell you how we can fill them.

Lumber Company**  
McCloud, California

of age and, in addition, many old people who had to have the most careful sustenance. One of the first duties of the relief was to undertake the import of milk in order that these children might be saved. We found that in the terror under which these people lived the average period of breast feeding was under four months. We have therefore for nearly four years been sending them American condensed milk, not in single cans, but by scores of thousands of tons. There has been scarcely a child born in the north of France, and few in Belgium, whose continued life has not been dependent during all this period upon American condensed milk. Every American would be thrilled could he but see the gratitude which French mothers daily express over the pitiable ration which enables their children to survive. This stealing of neighboring cattle by Germany will now, with Russia at her mercy, go on with an accelerated pace. Do not let us deceive ourselves that any shortage of her own cattle will bring the war to an end.

All this is an exhibit of the character of forces from which we are struggling to purge the world. To do this therefore we must concern ourselves daily with the food situation in the Allied countries. Our obligations to them are not only as a matter of humanity but as a matter of their maintenance in our common struggle. It is worse than folly to put 5,000,000 of our boys into France if the civilian population of our Allies is not also to be maintained in strength and morale with our food. We are also interested in the neutral countries from the point of common humanity.

The Allied countries before the war supplied their dairy products from imports as well as domestic production. Their imports came from Holland, Denmark, Siberia, Australia, the Argentine, New Zealand, to some extent from Canada, but comparatively nothing from the United States. The exports from Holland and Denmark have been largely cut off by embargo against the import of feeding stuffs to those nations in order to prevent their also supplying Germany. Siberia is of course isolated. Australia, New Zealand and the Argentine represent journeys which require from two to three times as much tonnage of ships as do our own markets to bring the same quantities. Dairy products still flow from these remote markets to the Allies although the transport of grain has been largely abandoned. But the growing shortage of shipping, the increased demands to transport the American army, might at any time necessitate such a final economy in shipping as would drive these demands upon us.

The shipping problem has, however, had a wider influence than the jeopardy of direct imports of dairy products in its effect upon Allied supplies, for their own cattle are much dependent upon the import of feed from overseas. In the struggle of all European populations to maintain or increase their bread grains in the face of a shortage in labor it has been necessary for them to diminish their production of feed for their animals. By the destruction of shipping it has been impossible for them to maintain the volume of their feed imports. In order to reduce this drain on shipping and to find immediate meat supplies there has been an enormous reduction in the number of cattle in all of the countries at war. Every nation in Europe has endeavored to protect its dairy herds, but the reduction in feeding stuffs has necessitated the placing of cattle on rations of a more drastic proportion than that of human beings. The result has been that while the actual number of dairy cattle shows less proportional diminution than that of the total cattle, the actual reduction in the milk production is of much larger proportions. I doubt whether today the dairy production of Europe as a whole is 30 per cent of the pre-war normal, and that of the Allies is 50 per cent of normal.

In consequence of all these forces the dairy supplies of the Allies are much diminished. They have met this situation by drastic reduction in consumption of dairy products, by driving the fresh milk into the hands of the children and by the substitution of margarine for butter. Their position is not yet acute and while it represents privation of many indi-

Continued on Page 739

## 30 Head Registered Guernsey Cattle FOR SALE

Owing to the unsatisfactory labor conditions, we have decided to sell 30 head of our GUERNSEYS. This consignment consists of a few good aged cows in calf, 12 head heifers two years past, now on test, average production for May, 1078.5 pounds milk. These heifers are bred true to type, nicely marked fawn and white, and show splendid udder development, most all safe in calf and are from high producing dams. They are sired by Langwater Emigrant 14076. His dam has A. R. record of 13,352 pounds milk, 626 pounds butter fat. They are also granddaughters of Imported King of the May 9001. There are six heifers coming two, bred, six bull calves and several heifer calves, six months or under, also one bull of serviceable age, whose four nearest dams have A. R. records that average 13,934 pounds milk, 677 pounds butter fat. These GUERNSEYS are of the great May Rose family, are direct descendants of Imported May Rose King and Dolly Bloom. This is the banner show herd of the northwest, they having won first prize in Get of Sire, Produce of Dam and Breeder's Herd at the various fairs of Oregon and Washington, 1916 and 1917.

These GUERNSEYS are good specimens of the breed and are priced to sell. For further description and prices, write

**Lumber-Sash-Doors-Plumbing - Supplies**—Building materials of all kinds. New and second hand. A. R. W. shingles 60c per bundle. Send list for estimate. Dan P. (Mission Street) Dolan, 1620-1650 Mission Street, San Francisco.

### FARM LANDS FOR SALE

#### Attention Land Buyers!

Here's an excellent proposition: 40 acre farms selling for \$15 to \$25 per acre, long time payments, 6 per cent interest, in the best agricultural part of Snohomish County, where you have all the modern conveniences, paved roads, railways, schools, churches, mills and factories. This district has proven its worth by the many successful farmers now located there. We also have some beautiful water front 10 acre tracts. OPPORTUNITY knocks at every man's door ONCE, but believe me, it does not continue to knock forever nor does it pound the door down. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

**No. 4501:** 50 acres Maryland mild climate, 5 woodland, 2 fine fruit, near railroad station, school, church and stores; produces wheat, corn, tomatoes, oats, etc. Two story shingle roof frame dwelling, 7 rooms, cellar, front and back porch, barn, corn house, shed, spring house, stable, smoke house, tool house, poultry house, tenant house. Near Baltimore. Price \$4000. Russell Realty Company, Baltimore, Maryland. Catalogue.

**For Sale or Exchange**—60 acres rich, alluvial silt soil. Level. Irrigated, ready for crop. Real alfalfa land. Domestic water on place. Plenty of irrigation water. 1¼ miles from town, churches, grammar and accredited high school. Half cash, half trade, anywhere. Make your proposition now. Chas. McNeely, Alpaugh, California.

**Fine level farm land**, California, 160 acres, best of soil. Plenty of water. Near oil belt. Close to McKittrick. We had an offer from oil company six years ago of \$150 per acre. Price now for quick sale \$100 per acre. J. H. Rule, 415 Canal Ave., Wilmington.

**Manteca soil** produces twenty-five tons tomatoes per acre. That's why Manteca has four canneries with two more projected. How much land do you want? Walter Buchanan, Route 2, Ripon, California.

**For Sale**—Fine Paying Lemon and Orange grove. Upland district, none better; 10 acres, ample water stock; good improvements. C. W. Knapp, El Centro, California.

**Thirty-five sacks** beans, thirty sacks corn, twenty-eight tons beets, twelve tons alfalfa, per acre on Manteca land. Grapes, peaches, olives, berries. Walter Buchanan, Ripon, California.

### POULTRY

**200 White Wyandotte 8-12 Week Pullets**, \$1.25, \$1.50, \$1.75, \$2.00; 200-260 egg trapneasted or prize. Guaranteed. June delivery. Hundred cockerels, pullets, breeders, chicks, eggs all breeds greatly reduced. Our early maturing winter layers grow rapidly into money makers. Red, Rock, Ancona, Minorca 25c chicks, 20c; 20c for 17c; 17c for 15c. Leghorns 2c cheaper. Ready weekly. Hens clearing \$5.00 yearly. James Beeson, Pasadena, Cal.

**Order Quick**—50 White Leghorns (best grade stock) by parcel post prepaid \$5.50; 100 for \$10. Brown Leghorns \$11. Buff Leghorns \$12 hundred next two weeks only. We hatch Barred and White Rocks, Minorcas, Reds for next five weeks. Send for circular and prices. They will interest you. Mission Hatchery, Campbell, California.

**Model Poultry Farm**, White Leghorn specialists, established 1903. We are now booking orders for May and June delivery of Baby Chix and Hatching eggs from our bred-to-lay stock. We still have a few 10 weeks old pullets to sell. Our prices are right. W. C. Smith, Prop., Corning, California.

**Book Your Orders for White, Brown or Buff Leghorns, Anconas, Barred or White Plymouth Rocks, Black Minorca chicks with the Stevenson Hatchery**, Watsonville, California.

**\$13.00 per 100 Barred Rox, Reds, B. Minorcas, White Leghorns \$9.00.** Terms \$2.00 with order, balance C. O. D. Ship Monday and Wednesday. A. G. Rowe, Inglewood, California.

**Black Orpingtons Lay**, Weigh and Pay—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, California.

**For Sale**—Brown Leghorn pullets, seven, six and five dollars dozen. Mrs. J. B. Guerard, R. D. 2, Box 26, Merced, California.

**White Leghorn Chicks**—Only two more hatches. Order quickly. All strong youngsters. J. H. Stubbe, Campbell, California.

**Buff Orpingtons, Buff Ducks, Bourbon Red turkeys**. The Ferris Ranch, S. Reservoir, Pomona, California.

**Eastman's Bred-to-Lay Barred Plymouth Rocks**. Hatching eggs. Fairmead Poultry Farm, Fairmead, California.

### AGRICULTURAL IMPLEMENTS

**A No. 2 Primrose Cream Separator** capacity 450 pounds per hour, has been turned over to the University to be sold for the benefit of the Red Cross. Any of our readers who need a new hand separator will do well to communicate with Professor F. W. Woll, University Farm, Davis, as it will be sold below catalog price if need be.

**IMPLEMENTS AND RANCH SUPPLIES**. Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC., The Yellow Front. Established 1892. 112-118 S. Los Angeles St., Los Angeles.

### PIGEONS

**Pigeons**—White Kings, Giant Runts, mated and young stock. F. Sanderson, 1170 Bird Ave., San Jose, Cal.

### CATTLE

**For Sale**—Guernsey bull, Coras Reputation of the Rancho, 32102. Sire, Glendette of Pinehurst; dam, Cora May. Born December 18, 1914. Bred by Knickerbocker Ice Co., Crystal Lake, Illinois. We are going out of the dairy business. This bull for sale at a sacrifice, price \$300. Floribel Farming and Cattle Co., Box 71, Hanford, California.

**Guernseys**—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., Cal.

**SHORTHORN CATTLE, SHROPSHIRE SHEEP**, Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, California.

**For Sale**—On account of dissolution of partnership will sell thirteen registered Guernsey cows. Choice individuals just in their prime. P. J. Weisel, Santa Fe Springs, California.

**Registered Holstein Bulls** from high producing dams for sale at reasonable prices. Also a few choice females. McAllister Sons, Chino, Cal.

**Registered Holstein Bull**—Straight, strong constitution, well marked, good pedigree. Write to Sunnybrook Ranch, Willits, California.

**Registered Shorthorns**, cows with calves at foot, yearling heifers and bulls for sale. Prices on application. Fair Oaks Ranch, Willits, Cal.

**For Sale**—One of Tehama County's best dairy herds. All fine grade Jersey cows, also young stock. Will sell in part or all. John Risse, Los Molinos, California.

**Venadera Jerseys**, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Ayrshires** (registered)—A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Arizona.

**Elkhorn Farm Ayrshires**—For sale young bulls of exceptional breeding and individuality. J. Henry Meyer, R. D. 2, Box 82, Watsonville, California.

**Sunshine Farm Jerseys**—Bulls from officially tested dams for sale. E. E. Greenough, Merced.

**Five Fine Jerseys** for sale, three cows, two heifers, fresh and coming fresh, priced right. R. T. Waters, Box 66, Route 6, Bakersfield.

**For Sale**—One registered Guernsey bull four years old. Abram Marron, Jr., Box 10, Oceanside.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, Cal. Registered Jerseys—1 yearling bull for sale. J. R. Carhart, Fullerton, Cal.

### HOGS

#### BERKSHIRES GUERNSEYS GRAPE WILD FARMS

A few fall boars left by Royal Superbus—also a limited number of fall gilts. We have early spring pigs of both sexes and we are breeding some top gilts for fall farrow. Prices upon application. A. B. HUMPHREY, Escalon, San Joaquin County, California.

**Poland-China Hogs**—On account of the draft must sell 4 tried brood sows bred to an extra good son of I. B. A. Wonder. 3 at \$75 each and one \$150. Also two yearling sows big, smooth, long and bred \$65 each. Also 4 September Big Bob gilts out of an imported sow will breed to Meddling Wonder \$55 each. One February boar \$50, two at \$35 and two at \$25. 4 February gilts at \$30 each. All recorded, crated and transferred f. o. b. Allen M. Lester, Care N. M. Lester, Gridley, California.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**"Billiken"** Chester Whites—The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar that is just 18 months old. C. B. Cunningham, Mills, California.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Rancho Rubio Durocs**—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

**Mule Foot Hogs**, large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums."

**Duroc-Jerseys**—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

## HOGS

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Large Type Poland Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, California.

**Duroc-Jerseys** — We breed the champions. Peters, Lamson & Walker, Devore, San Bernardino County, California.

**Greenwood Farm Durocs** — "Size with Quality." H. C. Witherow, Palo Cedro, California.

**HEWITT'S BIG TYPE POLAND-CHINA** gilts and boar pigs. Hewitt & Hewitt, Dixon, California.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Berkshires**—A few very fine March farrow pigs, sired by Fair Oaks Champion. Fair Oaks Ranch, Willits, California.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas** — A few good breeding boars. S. F. Williams, Orland, Cal.

**BIG TYPE POLANDS**  
W. H. BROWNING, WOODLAND, CAL.

## RABBITS

**Go Into Business for Yourself** — Raise rabbits for meat and fur. Raise stock for us. We buy all you raise. Orders booked now for March delivery. Our booklet mailed for 10 cents. Los Angeles Fur Farm, Dept. C. C., 2669 N. Griffin Ave., Los Angeles.

**A Fortune In Rabbits**—Have raised the price we will pay to \$3.00 per pair. Want you to raise them for us. Send stamp for particulars. H. E. Gibson Co., Arcadia, California.

**For Sale** — Rabbits. New Zealand and Flemish Giant, young stock. Paul Krueger, Watsonville, California.

**Rabbits, Remedies and Supplies.** Send for price list. Caldwell Rabbit Farm, Los Angeles.

## MISCELLANEOUS

**For Sale: Fruit Cars**—100 used fruit cars in good condition, size 3-ft by 5 ft. outside measurement, to fit track 25 1/4 inches; also 1500 feet 1/4 by 1 track iron. Price cars \$4.50, iron 6c per lineal foot, f. o. b. Santa Ana. C. C. Collins Co., Santa Ana.

**To Reduce the high cost of living**, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

## PATENT ATTORNEYS

**Patents that protect** are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "Patents."

## GOVERNMENT LAND

**Be Patriotic**—Raise stock. Oregon, California openings. Valuable land marked plainly on County sectional map. \$2.50 any county. Booklet Free. Joseph Clark, Sacramento, California.

## NATIONAL EGG LAYING CONTEST

By T. W. Noland

Missouri Poultry Experiment Station, Mountain Grove.

June is a good month to begin culling on the young birds. Feed is high and prices will probably be lower later on, as the cull hens will soon be placed on the market, as well as the rush of fryers. Look the birds over carefully for disqualifications, and symptoms of low vitality. Cockerels, not promising enough to keep as breeders, should be sold now, if weighing from one and one-half to two pounds. This will give more room for the pullets, and everyone is urged to keep all the pullets they have accommodations for. Feed them all they can eat, keep them growing that they may begin producing as early as possible.

## The Contest

Pen 36, S. C. White Leghorns from Missouri won the cup for May with record of 138 eggs. This is the highest record ever made by any pen in one month during the seven National Egg Laying Contests held at the Missouri state poultry experiment station. The total number of eggs laid in May was 5920 or an average of 19.7 per hen.

Following are the leading pens for each variety for May:

S. C. White Leghorns, Missouri, 138 eggs.

White Wyandotte, Illinois, 127 eggs.

Anconas, Missouri, 127 eggs.

S. C. Reds, Missouri, 126 eggs.

Barred Rocks, Michigan, 124 eggs.

S. Wyandottes, Missouri, 123 eggs.

Buff Wyandottes, Missouri, 123 eggs.

W. P. Rocks, Idaho, 122 eggs.

Black Orpingtons, Missouri, 117 eggs.

R. I. Whites, New Jersey, 116 eggs.  
S. C. Brown Leghorns, Missouri, 108 eggs.

Buff Orpingtons, Missouri, 107 eggs.

R. C. Reds, Missouri, 102 eggs.

Buff P. Rocks, Missouri, 94 eggs.

White Orpingtons, Missouri, 84 eggs.

Following are the ten leading pens to date:

R. I. Whites, New Jersey, 706 eggs.

Buff Orpingtons, Missouri, 701 eggs.

White Wyandottes, Missouri, 700 eggs.

Barred Rocks, Michigan, 680 eggs.

S. C. White Leghorns, Missouri, 677 eggs.

Barred Rocks, Missouri, 670 eggs.

White Wyandottes, Illinois, 662 eggs.

Anconas, Missouri, 660 eggs.

White Wyandottes, Missouri, 656 eggs.

S. C. Reds, Missouri, 650 eggs.

## Hens and the Land

Written for California Cultivator By Jean A. Koethen

**H**OW shall poultry production be maintained in the face of discouragements and handicaps of the greatest war the world has ever seen? How shall we get eggs for sick and wounded soldiers and poultry meat to supplement the inadequate supply of beef and pork? The Honorable Edward Brown, one of England's foremost poultry experts, who is now touring the United States in the interests of increased production, thinks he has the answer to the question, and if any one has it it should be Mr. Brown who has lived through 30 air raids on London and seen English specialists and farmers, panicky and bungling at first, finally settle down to the production of eggs and poultry sufficient for England's needs.

The solution of the problem, said Mr. Brown to an invited audience of poultry people at Exposition Park on May 24, does not lie with the specialist, but with the farmer and fruit grower, and then he made this astonishing statement: "The cultivated acreage of California is now supporting just one-tenth of a hen per acre." Think of that, you orchardists who are afraid to let hens run in the orchards for fear they will spoil your furrows! Think of that, you farmers who think hens are a bother and not worth feeding! Three hens to the acre, which would be 30 hens for a ten acre ranch, would increase our production 30 times and provide all the poultry products we and our allies need. Three hens to the acre would almost pick up their living if they were allowed to range. A little extra planting in the form of milo or feterita, kale and vegetables, added to what they picked up, would easily feed them.

This is the sort of poultry raising the English have had to come to, and Mr. Brown confidently predicts we shall come to it sooner or later. Intensive poultry husbandry, which he intimated had been borrowed from America anyhow, has almost disappeared. In its place are flocks running at large in field and orchard. Where hens are kept intensively green

feeds and vegetables are raised to supplement the inadequate amount of grain available. One expert feeds 50 per cent greens in various forms and finds that his hens lay fully as well as they did on a grain ration. Green feed and more range are the only solution the English have found to the vexed problem of a war ration.

But there are three sides to this question of range. The nation needs the hens; the hens need the lands (as range); and the land is even more in need of the hens. On this point also Mr. Brown was very emphatic. The relation of hens and land is as one to three; that is, a large number of hens kept one year on a given piece of ground leaves an amount of manure sufficient for three years' crops. He did not say how long the manure from three hens per acre would last, but it was inferred that at least this number kept constantly would be needed to keep the land in condition for growing crops. This is a lesson we Californians have been slow in learning, that land cannot produce fruit year after year without having the nourishment taken out by the orchards returned to it by poultry and live stock. In France and Belgium, where fruit production is very highly developed, this relation of live stock to fruit is so well understood that no one attempts to keep one without the other, and the finest orchards are those in which poultry runs constantly. When this system is followed a smaller number of hens is kept, but where is the use, argue the thrifty women of Flanders, of producing eggs without profit? Hens kept in this way may not lay quite as many eggs, but the eggs cost far less than when the hens are confined and fed expensive grains.

In concluding his address Mr. Brown stated that there is in Southern California a magnificent opportunity for growing market poultry. Here in America we have no market poultry worthy of the name. If one community of orchardists should take up this specialty and study seriously the raising of table poultry in their orchards the enterprise could be made immensely profitable.

## Storrs Egg Laying Contest

Storrs, Conn., May 30, 1918. Report for the thirtieth week ending May 29.

The hens in the laying trials at Storrs have yielded a little ground, but they are still in good order. Not only this, but they seem to have sufficient reserve; hence there is little doubt as to the final outcome of the competition. The total number of eggs for the thirtieth week was 4371, or a yield of 62 1/2 per cent; they laid 4578 last week and 4418 in the corresponding week last year. The Leghorn division struck hard last week and are still at it; they constitute 43 per cent of the birds entered in the contest, but are laying close up to 50 per cent of the eggs.

With the approach of summer weather, all flocks everywhere are likely to fall off a little in their production and unfortunately this cannot be entirely obviated. Some hints are so simple that when made the uninitiated consider them of only small importance. For instance, it is just as necessary that hens have water, clean fresh water, as to have feed. Add to this a bountiful supply of tender tempting green food, and then make a careful periodical examination for lice and mites and exterminate them and in most cases more eggs will result.

The three best pens in each of the principal varieties are as follows:

## Barred Plymouth Rocks

Jules F. Francias, 1170; Tom J. Adamson, 1118; Richard Allen, 1089.

## White Wyandottes

Obed G. Knight, 1249; F. W. Harris 1062; Brayman Farm, 1060.

## Rhode Island Reds

Richard Allen, 1176; Pinecrest Orchards, 1042; Chas. H. Lane, 1023.

## White Leghorns

A. P. Robinson, 1124; J. O. LeFevre, 1105; Braeside Poultry Farm, 1093.

## Miscellaneous

Oregon Agricultural College (Oregon), 1196; Cook & Porter, (Buff Wyandottes) 1038.

## STUDYING POULTRY FEEDS

Several interesting experiments are being conducted by the poultry plant of the University Farm at Davis. Chief among these are feeding tests comparing various rice products with the standard cereals such as wheat, barley, milo and cracked corn. Paddy rice and brew rice are being compared with wheat as a scratch grain for laying hens, and rice bran and rice polish are being substituted in the mash for wheat bran, shorts and ground barley. Experiments are also in progress to determine the relative advantages of free range and confinement for hens.

Clean up often, fight lice and mites. Disinfect the brooder or coops every few days. Use only good grade dry feeds. Make the little chicks exercise for their grain by feeding in a shallow litter of alfalfa leaves. Keep grit and shell before them all the time. Exert every possible effort to secure sour skim milk or buttermilk for them. It should be their first drink. Sour milk is our greatest aid in counteracting bacillary white diarrhoea. Granulated charcoal is good to correct digestive troubles. Be sure the chicks get some. Put enough potassium permanganate crystals in the drinking water to give it a faint wine color. This will counteract many contagious diseases.

The collapse of Russia was partly due to the lack of food supply for the army and the people.

War is scraping our sugar bins and our granaries. The less we waste the longer it will take to empty them.

### Easy to figure the Profits

Where in Western Canada you can buy at from \$15. to \$30. per acre good farm land that will raise 20 to 45 bushels to the acre of \$2. wheat—it's easy to figure the profits. Many Western Canadian farmers (scores of them from the U. S.) have paid for their land from a single crop. Such an opportunity for 100% profit on labor and investment is worth investigation. Canada extends to you a hearty invitation to settle on her

### FREE Homestead Lands of 160 Acres Each

or secure some of the low priced lands in Manitoba, Saskatchewan or Alberta. Think what you can make with wheat at \$2. a bushel and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed Farming and cattle raising. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature and particulars as to reduced railway rates to Supt. Immigration, Ottawa, Canada, or to

### HAPPY HOOVERIZING

Written for California Cultivator  
By I. M. M., Fresno

The birds are singing gayly  
Roses are in bloom  
The chicken's cackles daily  
Drive away the gloom.

Onions growing stronger,  
Potatoes looking fine.  
Hoover can no longer  
Cause a tremble in our spine.

Eats a growin' plenty,  
Makes you sing a song.  
Pockets may be empty,  
But—there's the dinner gong.

Apples baked and apple sass,  
Hoover bread and rolls,  
Potatoes mashed and "sparrow grass,"  
And bean soup in our bowls.

Good by pies and "sich like,"  
Good by roasts and stew,  
Till "our boys" can win the fight  
For our own Red, White and Blue.

We will bake our victory dishes  
To help to win the war,  
We'll eat corn bread and "fishes"  
And garden sass galore.

### THE WOMAN COUNTY AGRICULTURAL AGENT IN ARIZONA

JUST at this time when food is getting scarcer, and victory depends so much upon the food supply, the work of the farm woman becomes more important than ever before, hence the plan to have county agents to help the farmers' wives just as we have had for a number of years county agents or farm advisers to help the farmers.

Maricopa County was the first county in Arizona, and among the first in the United States, to have such an official. Miss Imogene Neeley began her work in this county last summer, and results now are beginning to count.

Her first work was to encourage as much as possible the conservation, by drying and canning, of as much of the products of the farms, gardens and orchards as possible. There is quite a general impression that farm women as well as probably their town sisters, do not take kindly to the idea of a stranger coming into their kitchens and "bossing." No doubt they would be excused if they did object, so the plan followed by the women agricultural agents is to hold neighborhood or community meetings. These are sometimes held at the churches, schools, or occasionally at some farm home.

The plan as I said before, is to hold community meetings. At the first meeting, which is generally only fairly well attended, a beginning is made, a demonstration of the particular kind of work to be taught is given, and a community committee, usually composed of three women, is chosen to interest the other women of the neighborhood. The cooperation of these community committees and practically all women has been hearty.

Miss Neeley has driven her car over hundreds of miles of Maricopa County roads, good and bad, and held meetings in nearly half a hundred places. The first meeting is usually followed by a second in two weeks, and the second meeting becomes somewhat of an experience meeting, as reports are made by those who put into use the lessons taught at the first demonstration. The community committee has, in the meantime, induced many more women to attend, and then wheels are moving in a way that really begins to count. Just as an example. One of the projects upon which special stress has been placed is in the use of substitutes for wheat flour. Demonstrations were given before a total of 3008 women, and reports from a portion of these proved that a saving of ten pounds of wheat flour for each person in a family had been made—a period of six weeks.

Other projects have been along the lines of saving meats, fats and sugar. Beginning May 1, there will be four months of a carefully planned campaign in canning, preserving, drying, and jelly making.

These are the big things that in the aggregate count in the amount of food conserved, and count in two ways for the individual home that learns of better methods and more economical ways is a winner, while every ounce of food that is saved which otherwise would have been wasted brings us

just a little nearer to the end of the war.

### CELLARS COOL AS THE SEASHORE

This applies not only to Arizona, for which it was written, but to hot sections in California as well. G. E. P. Smith, professor of irrigation engineering, University of Arizona, writes: "What has become of the cellar? The pioneer brought stock, implements, and even the windmill from his old home, but somehow he overlooked the cellar. The freedom from cyclones in Arizona does not imply that a cellar may not be useful in other ways. Nor should the fact that the red man had no cellar prevent his civilized successor from entrenching.

A cellar, like the seashore, has an equable climate. It is cool in summer and frostless in winter, a good place to keep milk and cream, potatoes and other vegetables, meat, fruit, the incubator, late-hatched turkeys, and a pressure tank for water supply to replace the unsanitary elevated tank.

A cellar need not be expensive. An eight-foot cellar requires six feet of excavation. For a cellar 18 feet square

Competent Home Furnishing Service.

## FRENCHGLOSS

### Is a Finishing Article for Home Use

It is used either with Starch or by itself for soft finish garments.

Its use gives all garments a smooth, pliable, lustrous wearing finish, that will keep fresh and clean from one-third to one-half longer than garments laundered without it.

You will find your ironing much easier and more satisfactory in every way when using FRENCHGLOSS. When used for starched garments you can save three-fourths of the amount of starch ordinarily used, besides having better looking clothes. You will also find that when garments have once been laundered with FRENCHGLOSS they wash much easier. The reason for this is that FRENCHGLOSS keeps dirt from working into the garments. If you boil your clothes, try dropping a couple of FRENCHGLOSS tablets in the boiler. It will surprise you the good it does.

FRENCHGLOSS is sold on a money-back offer: if not pleased with results your grocer will return your money. Price, 10 cents for a package large enough for six large family washings. By mail, if your grocer does not keep it.

**FRENCHGLOSS CO.**

1157 E. 12th St. Oakland, Cal.

### The Cultivator Patterns

8861

88387

8858

8619

8876

8852

8877

8861—Ladies' Waist. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The waist has a shoulder yoke which is more shallow at the front than at the back.

8387—Boys' Norfolk Suit. Cut in sizes 2, 4 and six years. The jacket has box plaits at front and back, and the separate trousers are included in the pattern.

8619—Ladies' One Piece Kitchen Apron. Cut in one size. The rounded extensions at the sides are lapped and buttoned over the hips.

8858—Ladies' One Piece Corset Cover. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The garment is all in one piece and it is to be slipped on over the head.

8876—Girls' Dress. Cut in sizes 4, 6, 8 and 10 years. The neck is slashed at center front so that the dress can be slipped on over the head.

8852—Ladies' Dress. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The waist is in regulation shirt waist style and the skirt is three gored.

8877—Ladies' Two Gored Tunic Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The tunic is opened at the front to show the underskirt.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT  
California Cultivator  
Los Angeles

only 72 cubic yards of excavation are required. Contract prices vary from 30 cents per cubic yard for soft earth requiring no pick work to \$1.00 per yard for hard caliche. Usually the farmer will make the excavation himself, using a slip scraper in part. The soft earth should be walled up and the caliche can be walled, but it is not essential. Excellent walls are made of plastered adobe. A new home is figured roughly at \$500 per room; the cost of a cellar will be the cheapest part of a house.

The city dweller is equally interested in a basement. A few of the best homes have comfortable basements which are used as living rooms during the hot summer afternoons. It is safe to say that the temperature will be from ten to 20 degrees cooler than that of the rooms above. Brick or cemented wall and a cement floor will make a cellar an ideal place in June for sewing machine, dining table, desk and bookcase. The writer knows one man who will nevermore build, lease or rent a home that has no cellar.

CANNING AND DRYING HINTS

Attractive labels sell the fruit. Take great care in putting them on. Paste should be put on one end of the label, not on the whole. Paste should be made of starch or flour; starch is to be preferred. Labels should not be wet or they will wrinkle. They should be straight on the cans, fitting well at top and bottom. Light colored labels are as a rule more attractive than dark ones. Put your name and address on label—if you have goods you are proud of and expect to sell another season.

Peach butter, pear butter, plum butter, apple butter, made of the less slightly fruit that will not bring the best of prices, will pay well if sold; they will pay even better if kept in the fruit press for use on wheatless bread.

If you have left overs of different kinds of vegetables from canning, put them together and can for soup vegetables.

The fresher and riper fruits are when canned, the better they will be and the less sugar they will take.

All dried fruits and vegetables should be stored in a dry, airy place away from insects and worms. Large tin cans or boxes, paper cartons and sacks make good containers.

Good dried fruit can almost be spoiled by poor cooking. Wash thoroughly; soak several hours; cook in water in which they have been soaked; cook slowly several hours to make plump and attractive and retain flavor; use as little water as possible and very little sugar.

Before going into the canning business, find out what your cans, labeling, fuel, marketing, etc. are going to cost.

Can vegetables and fruit as soon as possible after picking.

Don't have an empty preserving can in your home next fall.

Concentrate products so that each jar will hold as much food and as little water as possible.

Put up jams, jellies and preserves in glasses sealed with paraffin or paper; save regular tight sealing containers for concentrated soups, meats and vegetables.

Don't waste time and cans canning beans; they will keep just as well dry.

Potatoes, carrots, cabbage, onions, and such vegetables that can be kept by proper storage and grown through practically all the year should not be given place in cans needed for perishable stuff.

Dried corn and green beans are better than canned any day; but they take longer to cook. Try some this year.

If you have to buy your fruit and can raise tomatoes, try making tomato preserve and marmalade.

OF COURSE

A bellhop passed through the hall of the St. Francis Hotel whistling loudly.

"Young man," said Manager Woods sternly, "you should know that it is

against the rules of this hotel for an employe to whistle on duty."

"I am not whistling, sir," replied the boy, "I'm paging Mrs. Jones' dog." —Argonaut.

I'm but a cog in life's vast wheel  
That daily makes the same old trip,  
Yet what a joy it is to feel  
That but for me the wheel might slip!

'Tis something, after all, to jog  
Along, and be a first-class cog.

## Belladonna Raising Profitable

When it is taken into consideration that, when planted in rows three and one-half feet apart and spaced the same distance in the rows there are 3555 plants to an acre of Atropia Belladonna and that the leaves of this plant have not marketed for less than \$1.20 per pound (going as high as \$2.25 per pound) in the past three years it is not hard to conceive how a single acre planted at Pasadena yielded \$2400 in a single year on four cuttings of the leaves. Any intelligent boy or girl can operate a small planting of Belladonna in their spare hours and proper attention in the way of thorough cultivation after the plants are established cannot fail to bring good results. The Haas Seed Company, 1800 Lincoln Avenue, Pasadena, California, have a limited amount of high grade selected seed for sale. Any persons interested in securing guaranteed seed should write them for particulars.—Adv.

MARKET NOTES

All dealers in seeds whose stock  
amounted at any time during the past  
year to 500 pounds of vegetable seeds and  
5000 pounds of field seeds are required to  
report in all seeds stocks on hand on  
July 1. Make report to Bureau of Mar-  
kets, United States Department of Agri-  
culture, Washington, D. C. Blank sched-  
ule mailed under request.

Canners the United States over con-  
tracted for about 200,000 acres of toma-  
toes for the coming canning season. This  
is a material increase over that of last  
year.

In number of tomato canneries Vir-  
ginia leads all states with 179. Maryland  
follows with 160 canneries, and Indiana  
with 114, but Indiana's canneries handle  
over 30,000 cases of fruit which is nearly  
double that of Maryland or Virginia. Cal-  
ifornia's 38 canneries handle acreage of  
8513.

Wisconsin is the banner pea canning  
state of the Union. She has only 61 can-  
neries but handles the output of nearly  
33,000 acres. California has only seven  
pea canneries which handle the output  
of 1755 acres.

California yellow Bermuda onions are  
selling in Oregon for 1.40 to 1.75 per  
crate.

The state supreme court has upheld  
the constitutionality of the law creating  
the state market commission.

The Tulare County Canning Peach  
Growers' Association has fixed upon a  
price of \$55 for clings and \$45 for free  
stones.

California Lemon Club men have agreed  
to reduce the size of the lemon box to  
10x13x35 inside measurement. This will  
make the box conform to approximately  
the old 34 pound estimated weight.

Turlock reports her melons as growing  
fine and not injured by any spring frost.

It is estimated that this season's pro-  
duction of cantaloupes has run 175  
crates per acre or better. This is much  
better than the average of past seasons.

The tomato district of San Pedro, Los  
Angeles County will this year produce  
482 acres as compared with 250 last year.

The cantaloupe acreage of San Joaquin,  
Madera, and Merced Counties will be  
about 4245 as compared with 3120 last  
year.

Arizona has planted less acreage to  
cantaloupes this year than last but the  
condition is far better. It is estimated  
that her 1314 cars last year will be some-  
what increased. Shipping will not begin  
until last of month.

PARTIAL LIST OF CALIFORNIA FRUIT  
AND VEGETABLE SHIPMENTS

From post card reports to the Los An-  
geles branch of the bureau of markets,  
United States department of agriculture,  
report is made of the following ship-  
ment of cars of products from California  
for the week ending June 3: Apples 3;  
artichokes, 3; asparagus, 2; bananas, 1;  
cabbage, 30; cantaloupes, 30; carrots, 5;  
cherries, 45; cucumbers, 1; dried apples,  
3; dried beans, 1; dried olives, 1; dried  
prunes, 5; fresh peas, 2; fresh plums, 2;  
green string beans, 7; lettuce, 10; Mexi-  
can tomatoes into state, 2; mixed fruit,  
37; mixed vegetables, 53; mixed fruit and  
vegetables, 3; onions, 63; parsley, 1; po-  
tatoes, 30; raisins, 48; sweet potatoes, 1.

TOO INVIGORATING

Mrs. Smith (thoughtfully): "I'm  
afraid I shall have to stop giving  
Tommy that tonic the doctor left for  
him."

Mr. Smith (anxiously): "Why, isn't  
he any better?"

Mrs. Smith: "Oh, yes, but he has  
slid down the banister six times this  
morning, broken the hall lamp, two  
vases, a pitcher and a looking-glass;  
and I don't feel as if I could stand  
much more."

Grub-stake your home from the  
farm and garden; the railroads must  
carry food and munitions for soldiers.

UP TO US

Continued from Page 733

viduals of their usual food, they are  
sacrificing it willingly to the common  
cause.

During this fiscal year North Amer-  
ica will have supplied approximately  
50 per cent in nutritive values of the  
foodstuffs imported by the Allies, and  
50 per cent came from more remote  
markets. Before the war we con-  
tributed probably less than ten per  
cent. The shipping situation or the  
war situation might develop to a point  
where these ships must be withdrawn  
from the long journeys to the nearest  
market—our own. If that became  
necessary, and if we could supply the  
food, the Allied food carrying fleet  
could be diminished by 1,500,000 tons  
and still feed our associates in the  
war. This contingency may not arise,  
but if it should arise and we are un-  
prepared to meet this demand for a  
doubling of the whole of the food ex-  
ports from this country, it might re-  
sult in the losing of the war. If these  
ships should, by force of necessity,  
come to our shores they must be  
loaded.

No one knows how long the war will  
last. If we are to win we will with  
four collateral weapons — men, mu-  
nitions, ships and food. It may  
require years to win it and we in-  
tend to fight it out on this line—  
not if it takes all summer, but if it  
takes all of your lifetime and mine.  
We cannot anticipate that the animal  
situation in Europe will improve dur-  
ing the war. The enormous destruc-  
tion must go on until the end. Through  
the whole of the course of  
the war there will be continued de-  
struction of cattle and diminishing  
dairy products. There will be steady  
creeping of jeopardy towards the chil-  
dren of the Allies. North America  
stands unique in one great particular  
in this situation—we are independent  
of sea transport for feeding stuffs for  
our animals; we grow them side by  
side. Here lies the great economic  
difference in these foods between our-  
selves and Europe and here also the  
one reason why we can and must be  
the great final reservoir of supplies.

URGE SAVING IN BURLAP

Twenty-one million yards of bur-  
lap—material now growing scarce be-  
cause of its increased use in trench  
warfare, food shipments, and because  
of reduced importations — could be  
saved if fertilizer dealers would use  
200 pound bags instead of the more  
common 100 pound size. Pointing out  
that the burlap situation is steadily  
growing worse, the United States de-  
partment of agriculture makes this  
suggestion to fertilizer haulers for  
conserving the supply. The monetary  
saving possible in handling the 3,000-  
000 tons of fertilizers, now shipped in  
smaller bags, in 200 pound bags rather  
than in 100 pound sacks would be  
approximately \$4,000,000, it is esti-  
mated.

Bags are not only scarce, but the  
jute from which burlap bags are made  
is imported from India and the short-  
age of ships has materially interfered  
with the supply, while the necessity  
of furnishing bags for the army for  
trench use will further deplete those  
available. The total amount of fer-  
tilizer used in the United States an-  
nually is about 6,000,000 tons and of  
this at least half is being shipped in  
less than 200 pound bags. A short-  
age of burlap would ultimately reflect  
on such uses as for fertilizer in view  
of the priority need for food contain-  
ers, and it is held necessary that the  
use of burlap for carrying fertilizers  
should be cut to the greatest possible  
extent.

Another way in which burlap can be  
saved is by the use of second hand  
bags of any size. Many of these are  
on American farms. Dealers in sec-  
ond hand bags pay from 6 to 15 cents  
each, depending on size and condi-  
tion.

*Ranchers, Orchardists, Breeders, Dairymen, Poultry-  
men and Housekeepers should have a copy*

California Cultivator has published a new and most useful looseleaf book  
especially suitable for keeping records of crops, incomes and expenses on  
California ranches. Special pages are provided for **FRUIT CROP RECORDS,**  
**DAILY RECORDS OF LABOR, BREEDING RECORDS, FARM CROP**  
**ACCOUNTS, HOUSEHOLD EXPENSES, FIELD EXPENSES, CASH**  
**RECEIPTS, INDIVIDUAL TREE RECORDS, LEMON TREE RECORDS,**  
**PERIOD CITRUS TREE RECORDS, ANNUAL CITRUS TREE RECORDS,**  
in fact there is no combination of production so far found that cannot be  
easily and accurately kept in this neat, easy to keep Agricultural and Live-  
stock Account Book. It comes to your aid most effectually when you have  
to make out your tax assessment or your income tax report. Get one now  
and start to keeping a record of this year's crop and expenses.

**OUR SPECIAL OFFER.** We do not sell these books outright, but we  
desire to place as many of them as possible in the homes of California  
Cultivator readers. To that end we will send a book postpaid to anyone  
sending only \$1.25 for a year's subscription to California Cultivator, new or  
renewal and one book. If you will send your own renewal and one new sub-  
scription \$2.00 in all, we will send a copy of the book for securing the new  
subscription for us. Address all orders to

## Type of Humboldt Dairy Cows

Humboldt County's Natural Pastures Have Given Great Advantage to  
It as a Producer of Dairy Products. Butter Production,  
1917, Nearly 6,000,000 Pounds

# Feed 10 Cows at the Cost of Feeding 5

HAY AND  
GRAIN RATION

By Chas. B. Smith, Silo Authority.

A GOOD business man once said that the most interesting story you could tell any man was how he could make some money.

If you will give me FIVE MINUTES of your time—RIGHT NOW—I'll show you how a GOOD silo will earn you DOUBLE its cost in SIX MONTHS' TIME, for any dairyman or ranch-owner in California.

I've obtained figures from hundreds of dairymen all over this Coast. Boiled down, they average up about as follows: On a straight hay and grain ration the average cow will consume about 30 pounds of good hay and eight pounds of grain or chop each day. Where silage is introduced into the ration, the average cow will eat 15 pounds of good hay, three to four pounds of chop, and 30 to 35 pounds of silage. If you are feeding without a silo, you KNOW the first figures are correct; and any neighbor WITH a silo will tell you the latter figures are about right.

As to cost, during the past Winter good hay sold from \$20 to \$30 per ton, and good mill-feed from \$55 to \$75 per ton. Good corn silage, however, was produced for less than \$2.25 per ton last season, and it can be produced for \$2.50 per ton now. I'll verify these figures for you later on.

But this is not all. With good succulent silage added to the ration, your cows will produce more. Average figures given me by dairymen show at least a two-quart gain in milk per day per cow. On this conservative basis your gain is 20 quarts, or 40 pounds per day, or 7200 pounds in six months. At a price of \$2.25 per hundred pounds, which is low now, this repre-

sents a gain in returns of \$162. Add this to the \$382 gained in cost of feed and your 32 tons of silage has made you \$544 more from your ten head than if no silage had been used.

A 32-ton Indiana Silo—the best on the market—costs approximately \$225 at the factory. It wouldn't cost you over \$270 erected and painted. So that my claim that it will save DOUBLE its cost is well proven by the above figures.

But, you say—you PRODUCE your own hay and grain and hence it does not COST you so much. True, but it has to be charged against your live stock at what it would SELL for, so the result is the same. Again, you may think silage costs more. Let's see if it does. An ordinary yield of corn gives ten tons of silage to the acre. I figure its cost as follows, per acre:

Rent .....	\$ 7.50
Plowing .....	2.00
Harrowing twice .....	1.00
Discing .....	.70
Seed .....	.80
Planting .....	.75
Rolling .....	.75
Harrowing .....	.50
Cultivating four times .....	3.00
Ensiling .....	8.00

Total .....

\$25.00

—or \$2.50 per ton.

Any hay silage will cost you less per ton than corn.

From the figures, it will be comparatively easy for you to figure out just what a silo will do for you. Any silo user will tell you my figures are conservative, though conditions in different districts may cause them to vary some. But, even if a silo will do ONE-HALF as much as I have shown it will, isn't it foolish to try to feed live stock without one? YOU PAY FOR IT EVERY YEAR whether you use it or not.

## Mr. Smith's Figures Prove Facts

For example, suppose you are feeding ten head dairy cows over the six-month Winter feeding period. If no silo is used, your costs are about as follows:

30 pounds hay per cow per day, for 180 days—27 tons at \$20.....	\$540.00
8 pounds chop per cow per day, for 180 days— 7 tons at \$55.....	385.00

Cost of feeding ten cows, at lowest market figures .....

\$925.00

With a silo the figures change as follows:

15 pounds hay per cow per day, for 180 days—13½ tons at \$20.....	\$270.00
4 pounds chop per cow per day, for 180 days— 3½ tons at \$55.....	193.00
35 pounds silage per cow per day, for 180 days—32 tons at \$2.50.....	80.00

Cost of feeding ten cows with silo.....

\$543.00

Saving, \$382.00

One Dollar Per Year

## Humboldt, a Dairy County

**E**VERYBODY says it. Nobody denies it. That being the case why write about it? The good reason for writing once again about the wondrous wealth and still more wondrous possibilities for developing the great latent resources of this dairy section is that even those who know it best don't half realize what Humboldt is yet to become. The reason for writing is that seen for the first time some new angle of viewing the land, what has been and what may be done, may be touched on that may help Humboldt County men and those looking for a new location under most favorable conditions. As to scenic beauty the story has been well told, but no story can tell the grand epic of clear sparkling trout stream and river winding through sky soaring mountain and redwoods of such aspiring height that the mind rises with them to salute the Maker who maketh all things well. The fine pastoral scenes along the river valleys where the forest monarchs have given place to year around green meadows rich with natural as well as cultivated clovers and grasses that make this the happy home of the thousands of fine fat, sleek dairy cows which turn the green wealth of the fields into greenback dividends for their fortunate owners. In the recent year long dairy competition where herds from all over the state competed with their best Humboldt won all of the Cultivator's three one hundred dollar prizes.

Naturally we felt that a section that could do that needed a little more of our attention, and a trip has been made to find out if possible the why of it. The one word that spells the same as Humboldt, is prosperity, and while wealth is being produced from fisheries, forests, shipbuilding and other industries the great and enduring source of both present and future wealth is and will be the products of the field and dairy.

Native grass and native clover grow naturally the year round; the climate is mild and cattle pasture the full 12 months. Some hay is cut but in the main the cow is Humboldt's mowing machine. In addition to the native white clover, red clover grows luxuriantly. Rye grass is a favorite pasture grass, while shoulder high vetch and oats fed green make fat monthly cream checks the rule.

Owing to these conditions, silos are not largely used although some are being installed and provide a valuable change of rations. That they will increase in numbers is a certainty and that they will prove profitable is equally certain. The rainfall is heavy, mostly in the winter months, but showers generally come during much of the summer. The dairy farms are all in the river valleys which at one time were heavily wooded and have been cleared for farms at large expense. This desirable land is held at \$300 to \$500 and acre—when you can get it; it is in great demand. The three men who won each one of

the Cultivator's hundred dollar prizes in the state wide year long dairy cow competition were Iver Iverson of Arcata, J. W. Coppini and W. Tekelsen of Ferndale. They are all enterprising dairymen but with no fancy fixtures on their farms. Their cows have no petting or heavy feeding, and that they won for their owners tells again the story of green feed and mild climate coupled with careful work by real dairymen.

Iver Iverson hires his farm but has

May, then about four pounds a day till the middle of September, increased to six pounds for the balance of the year. Beginning the middle of August carrots were fed till December first then mangels till spring pasture time. Average fat for the test was 498.75 pounds per cow. The prizes won amounted to \$570 in cash, a pure bred bull and a cream separator. Mr. Iverson has recently purchased the entire registered Guernsey herd of Frank Helm of Fresno. This part of his herd is head-

Here there are 65 head, headed by a registered bull. Mr. Coppini has a particularly fine junior sire whose dams trace back on both sides to the Stoke Pogis blood, with strong strains of St. Lambert and Tormentor. His sire is Beauty's Lad of Champoege who goes back to Imported Golden Fern's Lad. The herd's senior sire, St. Helier of F., is sired by Olga Fern's Pogis, with line of Combination, Ida Marigold and other Jersey aristocrats in his family history. The two farms aggregate 150 acres and are real wealth producers. Mr. Coppini is recognized as one of the leading Jersey men of the state. His winnings in the contest were \$610 cash, a Calf Way milker, and a Simplex separator.

W. Tekelsen, the third of the Cultivator's one hundred dollar prize winners, has 76 acres just out of Ferndale. He is milking 50 head of well bred grade Jerseys headed by a registered Jersey bull.

G. E. Trigg of Ferndale, another contestant, farms 60 acres, has 38 milkers of splendidly selected Jerseys, 11 of which are registered. His winnings in contest totaled \$421, a Sharpless milker, and one of N. H. Locke's registered bulls. Mr. Trigg is acting secretary of the Ferndale Cow Testing Association which was started in 1909 with 2500 cows, now has 3500 cows with 500 on the waiting list. They employ three testers.

In conclusion, if the whole paper was given up to this Humboldt story it wouldn't be half told. The men written of are only a few of many equally worthy of mention for their herds and their work which is now as ever of vital importance to the state and the nation.

Junior Herd Sire

Type of stock which is making the dairy of J. W. Coppini, Ferndale, a prize winner.

recently purchased a farm that he will move upon as soon as his present lease expires. He has 37 head of well selected milking cows, Jersey and Guernsey blood predominating. They are well fed, well housed and cared for. They pasture on native grasses, are fed oats and vetch hay in winter in a common farmer type of barn with stanchions. During the contest they had alfalfa hay in November, December and January. About two pounds a day of a mixture of cottonseed meal, bran and cocoanut meal in April and

ed by Waseca of Bella Vista who is out of Imported Lord Kitchener. Briefly this is the story of one of the contestants and a typical Humboldt County dairyman.

The story of the others is similar as to conditions of work and feeding rations. J. W. Coppini of Ferndale, who also won a Cultivator hundred dollar prize, has 21 milking Jerseys, 16 of which are registered. Mr. Coppini is also a partner in the herd of very high grade Jerseys on the adjoining farm of Coppini & Coppini.

## The Carburetor and Its Work

**T**HESE are the days when the tractor is showing its ability to stand up under trying conditions. The humid heat of the past few days has not been felt by the tractor more than are normal conditions. It has, not been necessary to stop the machine to rest in the shade, and the operator has been able to accomplish as much as ever and, with a headlight, to get in nearly 24 hours per day. This week we use from Prof. J. B. Davidson's notes information as to carburetor, how to secure greater efficiency, etc.

### Construction

In general the modern carburetor consists in a nozzle, differing widely in form, but with a fuel level maintained slightly below its tip, and from which the fuel is drawn by the partial vacuum produced during the suction stroke of the piston and converted into a fine spray by the rush of air on its way to the cylinder.

### Factors Determining Richness of Mixture

Size of the nozzle opening. Viscosity of fuel (varies with temperature).

Distance of fuel level below nozzle. Suction or amount of vacuum produced in carburetor during suction stroke.

### Why a Carburetor Is Sensitive

The proportion of liquid fuel to air is small, usually about one to 16,000 when a proper mixture is used. The mixing is that of colorless gases or vapor "sight unseen."

### Economical Mixture

Gasoline or distillate vapor will not burn. There must be a sufficient amount of air present to support combustion. Gasoline and distillate is composed of carbon and hydrogen. When hydrogen is burned water is the resulting product and 62,000 B. T. U's of heat produced for each pound of hydrogen. To burn this hydrogen eight pounds of oxygen or 3418 pounds of air are required. When carbon is burned with insufficient air carbon monoxide is produced releasing 4400 B. T. U's per pound of carbon. When burned in the presence of an adequate supply of air carbon dioxide is produced releasing 14,500 B. T. U's of heat.

### To Determine Quality of Mixture

A lean mixture is slow burning

causing snapping back through the carburetor and produces a sharp exhaust.

A rich mixture burns the carbon to monoxide, which has a sharp prickling odor. Very rich mixture causes back smoke at the exhaust, due to free carbon and soot.

### Energy of Dynamite and Gasoline

The energy of 50 per cent dynamite per pound is 1825 B. T. U's or 1,419,850 foot pounds. The energy of gasoline per pound is 20,000 B. T. U's or 15,560,000 foot pounds or ten times as much as that of dynamite.

### Regulation of Fuel Level

Two methods of maintaining the proper level of gasoline below the nozzle:

By means of overflow cup.

By means of a float.

It is to be noted that some so-called generator valves and mixtures do not have either of the above, but such devices are influenced more or less by the height of the fuel in the supply tank.

### Vacuum Feed

The Stewart vacuum feed is a de-

# Agricultural News Notes of the Pacific Coast

## Northern California

Northern California citrus reports are for a bumper crop.

San Francisco is planning for a livestock show to open November 2.

El Dorado County Duroc breeders have organized.

Durham, Butte County, almond growers have joined the state association.

Napa County farm bureau is protesting against the Randall prohibition amendment.

Butte County citrus growers and rice growers are both hoping for warmer weather than has been given this season.

Lake County and Modoc County won the two grammar school prizes in Commissioner Hecke's squirrel prize offers.

Happy Valley, Shasta County, has the farthest north large olive planting. There are over 1000 acres in the plantation.

In 1914 the Sacramento Valley had a few garden and experimental plantings of spinach. This year's production was in excess of 3000 acres.

The state horticultural commission is now ready to supply strychnine and saccharin to farmers at the rate of \$5.50 per pound for saccharin and \$1.50 per ounce for strychnine.

Yolo County bean growers are perfecting a branch of the California Bean Growers' Association. Present indications are that Pinks will command about an eight cent figure.

The Sacramento Valley has planted more rice than any preceding year. Most of the grain is up and is making exceptionally fine growth. Yolo County alone has nearly 20,000 acres planted.

The rainfall this year, which was but little more than half of normal in the Sacramento Valley foothills, is calling attention of the irrigators to the need of storm water storage as never before.

Fall River, Shasta County, is producing its first large wheat crop made possible by better roads and trucks to take crop to the railways. This valley will produce far above its quota assigned last fall. It is estimated the output will be over 10,000,000 pounds.

The food commission reports that with several million bags to arrive early in July grain producers will have sufficient for the season. The price is 26½ cents f. o. b. San Francisco. Freight to interior points will cost approximately one cent a piece.

Thirty tons of dried potatoes put up by the Central California Creamery at Ferndale, under direction of the Humboldt County farm bureau, is now on its way to the trenches. It is hoped this will be the forerunner of a permanent industry in Humboldt County.

The Lassen Lumber and Box Company mill near Westwood, Lassen County, which has a capacity of 35,000 feet per day, is just beginning operations, and foundations are being laid for a second mill with nearly double its capacity.

The food administration will aid rice growers in Yolo County in the impartial division of irrigation waters. Any grower caught using water in excess of the amount signed up will be deprived of future use. Every grower must keep ditches and levees in repair so there shall be no waste.

## Central California

Peaches will run exceptionally large this year.

Tulare County foothills near Oroquieta are shipping tomatoes.

Dinuba, Tulare County, will ship 50 carloads of watermelons.

The Tulare Alfalfa Growers' Association has decided upon a \$20 a ton price for alfalfa.

James W. McCord, a Kings County pioneer, died recently at his home in Hanford.

Charts giving an outline of the new fruit standardization law are being placed in all fruit packing houses.

Chowchilla, Madera County, reports planting of rice much larger than anticipated.

Dried fruit handlers report great interest in all markets and predict good season.

An auction of fat hogs at Modesto was recently held. The top price was \$15.60.

The creamery at Keyes has been purchased by the Milk Producers of Central California.

San Joaquin Valley's grain harvest is in full swing. Barley is showing up better than anticipated.

Oakdale, Stanislaus County, is shipping some of the finest fat steers yet sent out.

Bean growers of Salida, Stanislaus County, recently met and organized for the purpose of bettering marketing conditions.

The Turlock district expects to ship 2500 cars of melons. Shipping will not begin till about the middle of July.

An insurance company has sued the owner of a steam tractor because of a fire started from sparks. The amount of the suit is over \$8000.

Water districts of Stanislaus County have been planning for the cleaning and improving of canals. One feature of the improvement will consist of one 4000 foot tunnel.

The forest service announces examinations for positions within the national forests to be held June 19 and 20 at Sisson, Siskiyou County, Quincy, Plumas County; Truckee, Nevada County; Sonora, Tulame County; Northfork, Madera County; Hume, Fresno County.

Monterey Bay is being planted to Pismo clams. The bay was formerly well stocked with these clams but they were taken out so freely before the present law was in effect that they were entirely killed off.

Cupertino, Santa Clara County, apricot growers are discussing prices of 1918 crop. Buyers in that section have been interested in circulating depressing stories as to the year's output and as to the attitude of the government.

The Peach Growers' Inc. are rushing work on a number of packing houses which must be completed before the 1918 crop is ready. President Wilson has assured growers that facilities will be provided for handling the crop economically.

The Madera County board of supervisors has enacted a fire prevention law, one feature of which provides a six foot firebreak around every field of grain or other inflammable crop. Every harvester and tractor must be supplied with two dependable chemical fire extinguishers.

## Southern California

Riverside fair is to stage a boys and girls pig club contest.

Irvine, Orange County, is building a \$15,000 walnut packing house.

Imperial County farm bureau has succeeded in selling 30,000 sacks of barley at \$2.10 f. o. b. Imperial Valley.

Santa Ana is building one of the most modern walnut packing plants in California.

Campers in the Santa Barbara national forest must secure permits before entering.

Riverside County bee keepers recently held a picnic supper at Claremont Park.

Lemon growers are pleased as they observe the \$9000 sales of lemons in Eastern markets.

An Orange County lemon grower reports that truckloads of lemons have been stolen from his orchard.

Broomcorn growers of the Palo Verde Valley recently met at Blythe and discussed cultural methods.

Palo Verde Valley will plant early Baart wheat for which that section is well adapted.

Walnut growers have had satisfactory results on aphids by spraying with tobacco dust or sometimes tobacco dust and hydrated lime, 50-50.

A manufacturer of harvesting machinery is contracting for hemp grown in the Imperial County at prices materially above those of last year.

Fullerton orange growers are organizing to prevent stealing of oranges. One orange grower reports the theft of 20 boxes.

The directors of the Lima Bean Growers Association recently met at Oxnard and listened to reports of President Perkins trip to Washington.

Suits are still filed against some bean growers because of failing to deliver full amount of beans contracted last year when prices advanced so rapidly.

Lankershim, Los Angeles County, hopes for the establishment of a large dehydrating plant. Turnips, carrots, celery, peas and beans will be handled.

Pomona Valley Poultry Producers' Association hopes to have better treatment from Los Angeles dealers because of the efforts of Food Commissioner Cole.

Permit has been granted for the use of the waters of Snow Creek and Whitewater River in Riverside County for the purpose of generating electric power for a million dollar cement plant soon to be built.

The California Walnut Growers' Association is distributing a \$112,000 surplus to the members. The selling cost the past year was two and one-half per cent. The culls marketed by the association netted 11 cents.

Apple growers of Chino Valley have applied for articles of incorporation. The association will this year hire the Narod packing house. It is expected that the cull fruit will be handled in the cannery of the San Antonio growers' association.

Secretary Burke of the Santa Ana Valley Walnut Growers' Association estimates the walnut crop this year at 40 to 50 per cent of normal. The shortage he says is caused by the heat of last June which burned up many of the fruit stems.

## The Coast and General

Citrus crop all right yet; no abnormal June drop reported.

Boys of Portland Y. M. C. A. are picking Hood River strawberries.

Utah is planting largely to late potato crop.

The cutting of olive trees in Italy for fuel or any other purpose is now prohibited by decree of the king.

The schools of Snohomish County, Washington, have purchased \$50,000 worth of war savings stamps.

Isle of Pines farmers will produce 1500 acres of castor beans for the United States government.

Recent cold rain destroyed 270 head of sheep for one company in Washington.

England's potato acreage in 1918 approximates 900,000. Every county in the country shows an increase.

New Zealand has ruled that all imports of luxuries or other than essentials shall cease.

One hunter of Morrow County, Oregon, recently bagged 124 coyotes within 30 days.

County agricultural agent for Wasco County, Oregon, reports 25 squirrel extermination clubs organized.

Wenatchee Valley, Washington, estimated a bumper apple crop, normal apricot crop, peaches and cherries very light.

Shipments of live stock through Pittsburg stockyards have greatly decreased because of federal routing over more direct lines.

The governor of Idaho has proclaimed that all pool halls shall be closed from 6 a. m. to 6 p. m. This because of the labor shortage.

A Canadian order in council has been made providing that all persons between ages of 16 and 60 must be engaged in useful occupations.

The Argentine government estimates the corn crop this year will aggregate 4,355,000 tons. Two and a half million tons of that amount can be exported.

Arkansas saved over 40,000 barrels of wheat flour which has been sent to France, and California's conservation has resulted in releasing 65,000 barrels of flour.

The food administration has ruled that vessels leaving American ports for South American or other countries where wheat is produced may have only wheat flour sufficient to carry them to the other port.

Great Britain has purchased the whole of the Australian wool clip for the period of the war and one year after. It is the largest wool transaction in the history of the world. The first two clips will involve the sum of \$100,000,000.

All farmers of California have been asked to file blanks stating their needs for labor with Prof. R. L. Adams at Berkeley, the California Federation of Farmers Cooperative Marketing Association, or with any one of their employment agencies.

For the first time in years the great tithing granaries of the Mormon church are absolutely clean of grain. This supply of wheat has been built up under the regime of Brigham Young and his successors and came in good time to aid the world in its need.

# Development of Dried Vegetable Industry

By E. Clemens Horst

THE Pacific Coast is embarking on a new industry that seems destined to rival that of the raisin and dried fruit lines. Dried vegetables, although not new to European countries, were practically unknown to this country until the advent of the war. There are now ten vegetable drying plants in California and Oregon, and more are under construction. A great impetus was given to the industry when the war department contracted for \$1,000,000 worth of evaporated vegetables for use of the soldier abroad. In addition to the purchases made by the government, a strong and increasing demand has sprung up for the product from hotels, cafes, hospitals and public institutions, and as the many advantages of dried vegetables are disclosed to consumers by a trial, the demands for the different varieties increases.

In the drying plants are processed practically every kind of vegetable, fruit and berry suitable for dehydration, and a vast superior quality of food is produced. The army is buying dried potatoes, carrots, and these products are packed in tin cans two of which form a crate easily handled by one man. The dried vegetables intended for use in the United States are packed in paper cartons, protected against moisture by waxed paper.

California, with its long growing season, and climatic conditions conducive to large and superior crops, is admirably adapted to the growing and dehydration of vegetables. In the sunny valleys, protected against frost, and with abundant water for irrigation, it is possible to grow vegetables during most of the year, and by rotating the crops the drying plants can be kept in operation continuously. In the season when fresh produce is not available, the plants can operate on potatoes, which can be carried in storage for the purpose.

The vegetables used for drying are practically all grown in the immediate vicinity of the drying plants, thus facilitating the picking and handling of the product and resulting in securing absolutely fresh stock. Owing to war conditions, the acreage formerly devoted to hops has been greatly restricted and these lands are now used for the growing of vegetables. Prac-

tically all of the vegetable drying plants were formerly hop driers, and very few changes were needed to adapt them to their new use. In addition to the vegetables grown on my own lands, contracts are made with nearby producers of vegetables, as the demands for the dried product are so great that a ready market is assured this season for all the vegetables within reach of the plants.

The sole object of the dehydration process is to exhaust the moisture content of the green vegetable, and in doing this nothing is added to preserve the product, as in extracting the water the perishable portion of vegetables is eliminated and the dried article will keep indefinitely. The flavor, texture and good qualities of the vegetable are in no way impaired, and when the dried product is soaked in water for a short time, the original bulk is restored, and when cooked it is difficult to tell the dried from the fresh.

When the green vegetable is first received at the drying plant it is placed on sorting tables, where young women pick out weeds, imperfect parts, and remove the tops or outside leaves of the vegetables. Such produce as spinach or cabbage is then placed in large revolving drums which toss the leaves about, during which operation they are thoroughly cleaned by jets of water. From the cleaning drum the leaves are conveyed by an endless belt to the drying trays where they are deposited in thin layers and taken to the drying room. Potatoes, carrots and such vegetables as require peeling, are cut into round shapes by hand after which they are placed in revolving drums which peel them evenly and without waste. From the peeling drums they pass through machines which slice them to desired sizes. In these various machines streams of pure water are constantly playing, insuring absolute cleanliness. Inspectors watch the product at various stages and pick out unsound parts. Potatoes, before going to the drying trays, are steamed for a minute or two to make them perfectly white. The drying trays are made of flat frames which enables the warm air to reach every portion of the vegetable. The

trays are placed in grooved shelves, where a warm current of dry air circulates through the product and slowly extracts the moisture. No chemical changes occur in the vegetables during the drying process and thus the full flavor is maintained. The dried product is placed in the containers in which it will be marketed, and these are sealed immediately to prevent dust from accumulating. When the dried vegetables reach the consumer they are pure and as clean as any food product on the market, and the whole process is designed to prevent the food from coming into contact with the human hands from the time it is first sorted. The operators who spread the layers evenly on the drying trays use wooden rakes and wear cloth gloves.

There is absolutely no waste of any portion of the vegetables processed as all of the green tops, peelings and even the water which washes the product is saved and fed to cattle and pigs. The waste water is run into bins where it is mixed with the green feed and this combination is greatly relished by hogs and makes a good feed for fattening.

The development of the dried vegetable industry will mean much to the producers, because it will insure a permanent and reliable market for vegetables. The great loss through wiltage and deterioration incident to the marketing of fresh vegetables will be avoided, because the green produce can be picked in the field as needed and taken direct to the drying plant.

It will mean that a tremendous saving can be effected in the handling of food supplies. As fresh or canned vegetables contain from 60 to 85 per cent of water, the transportation equipment, handling charges, and freight or express charges are expended in handling from 60 to 85 per cent of weight and volume of something that is not food. Furthermore, in canned goods the cost of small cans and wooden crates needed for vegetables runs into big figures, whereas the containers needed to handle dried vegetables are inexpensive and can be made of material not needed for other purposes. A pound of dried tomatoes is equivalent to 20 pounds of

fresh, and a cube of compressed dried tomatoes weighing two and one-quarter ounces has the same food value as a case of canned tomatoes weighing 60 pounds. In a carload of canned goods 24,000 pounds of the total weight of the shipment is made up of tin and wooden crates, all of which the consumer must pay for when buying his food. This comparison is not intended as a reflection upon canned vegetables, for they are excellent food and serve a very useful purpose, but it is given to indicate the many economic advantages which are possessed by the evaporated vegetables. These advantages largely influenced the government in contracting for the large quantities now being purchased for the American army abroad. It is estimated that one shipload of dried vegetables is equivalent to 30 shiploads of the same vegetables in a canned state.

From the standpoint of the consumer, the dried vegetables offer many advantages. Possessing the flavor and food values of the green, their use will enable a hotel, cafe, or the housewife to serve almost any kind of vegetable at any time, in the dead of winter as easily as in the middle of summer. Such famous hotels as the Biltmore of New York, the Willard of Washington, the St. Francis of San Francisco, and scores of others are using these products regularly in their service and they report that guests are entirely satisfied. Stewards of vessels have found that the use of dried vegetables enables them to carry a larger variety of food products in less space than under old conditions, and a wide market is being built up with steamship companies. Dietitians of hospitals recommend the use of the dried vegetables because they have found them to be absolutely pure food, and superior in taste and quality to canned goods. The housewife is growing to depend upon dried vegetables because they eliminate the large expenditure of time and trouble necessary to prepare green vegetables for cooking, and there is no waste to throw away.

The evaporation of vegetables, although meeting with marked success in California, can easily be carried on in almost any part of the country where vegetables are produced, though the season would necessarily be shorter.

## Spinach Production in California

WHILE spinach has long been the principal variety of greens grown for local consumption, it is only within the last few years that it has assumed an important place as a commercial crop in California. In this state it is grown commonly for local markets, extensively for canning, in an increasing area for seed production, occasionally for Eastern shipment, and is also coming into use for an evaporated vegetable.

As a canning crop the extension of the area of spinach cultivated has been so rapid that it has been nothing short of phenomenal, and spinach is now entitled to a conspicuous place in the records of the California pack of vegetables. Close to 3000 acres were planted for the 1918 spring pack. The installation of machinery which is said to be successful in washing out grit and foreign matter has popularized canned spinach, creating an

active demand and the good prices which follow as a natural consequence. This has given spinach canning a great impetus. Cannerymen have thus been enabled to use their plants at a period of the year in advance of the fruit season, for spinach is ready for canning earlier than any other product, the canneries starting on it still earlier than on asparagus.

It is handled by 14 different plants in this state and would have been taken up by others had the supply of good seed not been short. It is packed in Southern California and as far north as Mendocino and Butte Counties, the largest growing district in the state being in the vicinity of Sacramento.

As a commercial shipping vegetable, spinach has not kept pace in California with the canning crop, yet it has attracted more attention than usual during the past winter. While the shipping of spinach from South-

ern districts has grown to such an extent in recent years that it is reported to have largely displaced hotbed and cold frame culture in the vicinity of the principal markets of the United States, there are special difficulties connected with long distance shipment of spinach which discourages the transcontinental shipment of this perishable product and makes California production for this purpose unprofitable except under circumstances which existed during the past winter. With a crop failure in other districts which usually supply the Eastern markets the Pacific Coast was called upon for spinach and sent it forward in express cars. Los Angeles and the Coachella Valley of Southern California shipped out a few cars and Walla Walla Valley of Washington also furnished a supply, both getting excellent returns. Ordinarily spinach is also shipped in mixed cars to a limited extent to Western mar-

kets. The probability is that spinach will again be grown in these districts though there are no indications that prices will equal the abnormal prices of 1918. Much of it came from the vicinity of Puente, Tropico, Glendale and Gardena.

The maximum yields of spinach run high. On good soil under intensive cultivation eight tons per acre is not uncommon in a favorable season. The average in 1917 as reported by numerous growers, canners and shippers was four tons per acre. The normal production as estimated by the same authorities in various parts of the state is six tons per acre, which was closely approximated by the 1918 yields in the Sacramento Valley. Exceptional yields of from 10 to 20 tons have been reported and in one instance a yield of 22 tons per acre, which seems almost incredible, is on record. It is true, however, that the yields vary widely

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

Mr. Briggs has been up in Humboldt County and secured a fund of information from winners of the Cultivator prizes in the California Dairy Cow Competition. Mr. Copini, Mr. Iverson and Mr. Terkelsen were the three winners of the Cultivator's \$300. The reasons for the winnings of these three men, all in one county, may be in small part due to the rich natural pastures, but we think the fact that the winnings were in the county which has the oldest cow testing association in the state is more significant. We doubt not that half a dozen years ago would have found as many unprofitable cows in Humboldt County as any other, but dairymen in that county appreciated the necessity of wiping out the boarder or else the boarder would wipe out the dairy industry; hence cow testing associations; hence the type of dairy cow shown on cover of this issue.

## W. S. S.

This is a time when we are all true sports, and this is the week of War Savings Stamps. The drive will end Friday, June 28, and Mr. Vanderlip, who originated the idea, and all the rest of United States propose to see to it that before midnight of the 28th two billions in this smallest of all government bonds shall be subscribed. Two billions means an average of \$20 for every man, woman

and child in the United States. In face of the fact that we have one-fifth of us subscribed for liberty bonds, and all of us have given of our substance and service to the Red Cross and other war activities, at first thought we are inclined to say; "We have done our duty; let others take the stamps." But, as we noted, Americans are true sports, and such thought obtains only for a moment. Bring us on the war stamps; we will all do our share.

## 100 PER CENT PATRIOTIC

At the beginning of the Second Liberty Loan drive workers were rather free in their charge that the farmers were not doing their share. It was asserted that the farmers were content with answering the call to produce more and that they claimed exemption on the ground of the need of all their funds for seed, new equipment, etc. At that time the editor of the Cultivator called on those in charge of the campaign and asked if

A dispatch to the state department recently says that the Berliner Tageblatt in its issue of June 10 quoted a German general as saying that American military activity was very embarrassing to German military strategy and military writers, as it did not coincide with the German program for influencing opinion at home.—L. A. Times Dispatch.

any evidence could be given to prove such an assertion. No evidence was given; only other assertions were made. And at the close of the drive attention was called to the self-evident fact that the farmers did their share. The charge has not been made since, we believe. On the contrary we note in "The Bache Review," a summary of the general financial and business situation, issued by a member of the New York Stock Exchange just after the close of the Third Liberty Loan drive: "Fully offsetting any idea that the country is not waking fully to its responsibilities is the enormous distribution of the Third Liberty Loan. Instead of relying upon the East and the very rich, the demonstration is of the great rank and file in the West showing its earnest appreciation of the situation and the coming in of the farming communities in overwhelming volume and numbers."

We are glad to see justice accorded to the West generally and to the producing interests particularly.

## DEPRECIATION

In discussing the matter of lemon production cost before the tariff commission conference in Los Angeles this week C. C. Teague referred to the matter of depreciation on equipment. Commissioner Culbertson inquired if depreciation were generally considered by lemon growers of California, and Mr. Teague questioned whether growers generally make such deduction in figuring their costs.

We think we may safely add that too many lemon and other growers do not compute costs at all. "Rule of thumb" is proverbial in most farming operations, but citrus producers perhaps give more general attention to bookkeeping operations than the farmer of the Middle West. In the matter of depreciation the federal government has not permitted allowance for depreciation of citrus orchards, but it does permit consideration of depreciation of implements and equipment generally.

As to the depreciation on equipment used in production of lemons Mr. Teague has found that 16 cents per

box is required to cover this item so seldom considered. When a "good year" comes the fruit grower is enabled to cast aside worn out equipment and purchase other. Both ends meet, and all is well. But times like the present when definite facts are desired in the interest of the general welfare of the industry such "book-keeping" gives little comfort to those who want concrete facts. "About so much" has little force with the thinking investigator.

## THE TARIFF COMMISSION

After the long strife over the enactment of the present tariff law, suggestions were made as to the advisability of having tariff legislation referred to a commission which should make a study of the needs of the country and its various industries, and that future legislation should be based on facts brought out by this investigation. A bill was passed which was approved September 8, 1916. The announced purpose of this bill was

"for increasing the revenue and for other purposes." Six commissioners were appointed for terms of two, four, six, eight, ten and 12 years, and it was provided that thereafter all appointments should be for the term of 12 years. On March 21, 1917 President Wilson appointed Frank Taussig, who is now chairman of the committee, Daniel C. Roper, David J. Lewis, William Kent, William S. Culbertson, and Edward P. Costigan. Mr. Roper has since resigned because of appointment as commissioner of internal revenue. After confirmation the commission entered at once upon its investigations.

One of the first problems taken up was that of the chemical industry. As indicating the importance of some features of this work, Mr. Culbertson referred in one of his California hearings to that fact that in the matter of dyes this country formerly imported practically all its needs. American chemists have not only met these needs of American manufacturers, but American manufacture of dyes has increased until today this country is exporting more than all she imported four years ago.

In seeking solution of its problems the commission has carried its investigations directly into the field where conferences are held with those most vitally concerned in the industry under investigation. Experts in steel, in textiles, in chemicals, and in agricultural products are employed. All the conferences are held by members of the commission. Most of the conferences in California are for the purpose of investigating as to agricultural questions. However, in San Francisco conferences will be held with representatives of mining, manufacturing and chemical interests.

William S. Culbertson, who is conducting the conferences on the Coast, has impressed all with his entire fairness and his desire to get at the facts which will enable his commission and congress to arrive at proper conclusions. The commission will make its first extended report to the United States congress on the first Monday of next December.

A good citizen is known by the food he eats.

## This Week's War Notes

The French people and American troops in France celebrated June 13, the first anniversary of the landing of American troops in France.

There is still an occasional sinking on this side of the Atlantic. The last vessel known to have been sunk was the Samoa, a vessel of 1051 tons.

An American officer has been killed and four of his men held prisoners on the Mexican border line. General Wood has the matter in hand and is making investigation.

Premier Orlando of Italy has informed the Allies of a peace proposition made by the Central Powers to Italy, which has been rejected, and the premier has wired Washington that his people stand solidly with the Entente.

Semi-official announcement has it that the Fourth Liberty Loan drive will soon be announced. The amount asked of the people will be much greater than any preceding issue, and the interest may be higher. Secretary McAdoo has announced it will probably be for \$6,000,000,000, bearing four and one-half per cent.

The American Federation of Labor in convention at St. Paul has given opportunity to pacifists and pro-German sympathizers to make an attack upon Samuel Gompers. Copies of the socialistic German paper, New York Vorwaerts have been circulated, containing articles bitterly denouncing Gompers and extravagantly praising Schleissinger, the pacifist floor leader.

The most serious effect of the submarine activity on this side is caused by the destruction of many thousands of tons of sugar coming to this country from the Islands. This is one occasion for the new sugar order which now reduces purchases to three pounds per person per month. This, excepting in case of canning fruit needs, when a 25 pound purchase may be made on signing of pledge.

The W. S. S. drive is on this week. The half year since the drive started finds much less than one-fourth of the two billions expected from the sale of these stamps realized. Hence the present week with its whirlwind ending on June 28 is expected to afford the opportunity for the selling or at least for the pledging of the sale of the remainder of the issue. Pledges will be presented to all the people, giving opportunity to purchase a certain number month by month until December 31, when all the stamps are supposed to be purchased.

The English troops on the western front have made several minor advances, one midnight attack permitting the Tommies to advance over 500 yards. American troops have been active, and at no point have they been forced to give way. On the whole General Foch holds the advantage. Some have felt that the stopping of the German drive was a confession of defeat, but the more general impression is that the Germans have simply halted for recovery and bringing up artillery. The situation is far more hopeful to the Allies than a week ago.

The Austrian and German forces have begun their drive on the line in northern Italy, have succeeded in crossing the Piave at various points and have been vigorously repelled by English and Italian forces. The British report capture of a large number of prisoners and of Austrian guns. The Italians have done some exceptionally brilliant work, especially with artillery. Austrian prisoners captured are reported as ill fed and poorly equipped. The Italians are jubilant and are asking for four divisions of American troops, and assert that if these are given; "We will all march together into Austria." It is said that practically the entire Austrian army is now in northern Italy.

#### **Results of "One a Day" Pledge**

If you buy one War Savings Stamp each day from July 1st to December 31st (184 stamps) the cost to you will be \$773.71. January 1st, 1923, the U. S. Government will pay you \$920.00---or \$146.29 more than you invested.

#### **Results of "One a Week" Pledge**

If you buy one War Savings Stamp each week starting with July 5th until the end of 1918 (26 stamps) the cost to you will be \$109.33. January 1st, 1923, you will receive \$130---or \$20.67 more than you invested.

#### **Results of "One Every Other Week" Pledge**

If you buy one War Savings Stamp every other week beginning with July 5th until the end of 1918 (13 stamps) your outlay will be \$54.65. On January 1st, 1923, the sum of \$65 will be paid to you---just \$10.35 more than you invested.

# W.S.S.

## WAR SAVINGS STAMPS

### ISSUED BY THE UNITED STATES GOVERNMENT

#### **Results of "One a Month" Pledge**

Suppose you take one War Savings Stamp each month for the balance of the year (6 months), you will pay \$25.23 for them, and on January 1st, 1923, you will receive \$30---a gain of \$4.77 over your investment.

#### **Results of the "Limit" Pledge**

If you can purchase as many War Savings Stamps as the Government permits you to (one thousand dollars' worth) then pledge yourself to buy 35 stamps in July and 33 stamps each month during the remainder of the year (200 stamps in all). The cost will be \$840.95. January 1st, 1923, you will receive \$1000---or \$159.05 more than you invested. Ask your town chairman about the Limit Club now forming.

## TEAGUE QUALITY CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

## Sulphuring Fruit for Drying

Written for California Cultivator By Aratus Everett

IN COMPLIANCE with your request for an article on sulphuring fruit for drying will say that I have had 35 or 40 years experience in California, mostly with apricots.

In the early days of fruit drying, and even during Dr. Wylie's crusade ten or 12 years ago against sulphuring the wise ones writing in some papers advocated from one-half to one and one-half hours sulphuring. Their lack of actual experience resulted in great loss to those who followed their advice.

We know that large sized fruit, especially near the Coast, will decay on the trays and turn dark while drying with this amount of sulphuring; also will keep turning darker with age.

The object of sulphuring is to break up the fruit cells or tissue and also to kill germs that start the decaying process as soon as the fruit is cut and exposed to the air. Therefore it should have its sulphur bath as soon as practical after cutting.

Those who have to dry in a limited way would find it to their advantage to keep the cut fruit moist by sprinkling it with salty water as sulphur will not properly bleach if the cut surface has dried over. Apples, pears and some other fruits are benefited

by dropping into salty water after they are prepared for drying till you are ready to sulphur them.

These fruits generally require heavy sulphuring. Green fruit requires more sulphuring than ripe fruit.

First it is essential to use nothing but first grade flowers of sulphur. The term flowers means a double (at least) subliming process.

Have sulphur house tight with control of air or ventilation near the place of burning as even sulphur will not burn without air.

A shallow hole or a metal pan in the sulphur house to burn it in is sufficient. Good sulphur will start readily and burn up clean. But if trouble is experienced a sheet of paper under the sulphur furnishes air and combustion.

Don't use combustible liquids to start it with; a match with a little paper is sufficient.

Various kinds of sulphuring houses are used. Cheap and efficient ones can be made of boards lined with paper or a frame covered with paper.

Tongue and grooved lumber is no good as it leaks the fumes around the grooves.

On apricots and other stone fruits use about 12 pounds sulphur to the green ton and leave it in its sulphur bath about five hours; even a longer time for sulphuring does no injury.

## Fresh Fruit Standardization

In the principal fresh fruit shipping counties of the state the horticultural commissioners are active in the enforcement of the new standardization law. Fruit interests everywhere are coming to recognize the fact that more work must be done along this line as the fruit industry develops. During the early season is a time when such work is exceedingly important. California's reputation has been injured in times past because of the shipment of immature fruit. There has always been a desire on the part of certain interests to be the first to place fruit of certain kinds in the markets of the country. This desire has led them to pick fruit while it was too green and as a consequence when the markets were reached it was practically unfit for consumption.

The county horticultural commis-

sioner now has it in his power to prevent the shipment of such green fruit from his county. Just recently Horticultural Commissioner Brosius of Sacramento County intercepted early season shipments of both peaches and apricots. While this little incident in itself might not seem to be of much consequence, in reality the effect has been far reaching. The interception of one shipment in the early season may be the means of holding back many carloads until a time when the fruit is ready for shipment. One of the biggest jobs right now for the county horticultural commissioner in any county of the state where fresh fruit is being packed for shipment is to inspect such fruit and prevent violations of the standardization act. It is hoped that no one will minimize the importance of this work, which each season will develop and will ultimately than at present.

## Millions of Dollars Due

By an Irrigator

WHEN the Newlands irrigation law was passed in June, 1902, it was provided that all money paid in from the sale of public lands should be used to reclaim the arid districts in the different Western states. Under this provision arose the national irrigation money, from which fund some of our Western states have received more than ten times over the sum that was actually due them. Some of the states that received these huge sums were Arizona, amounting to \$17,393,367, while all that was due to it from the sale of public lands was \$1,430,751; Nevada had only \$656,467 to its credit from the sale of its public domains, yet received and spent \$5,786,828. This strange method of apportioning money was due to the activity of the people in Western

states, who first raised a fund of \$5000 up to \$40,000 and with these funds carried on a vigorous campaign between their state and Washington, which ended in their getting these millions to develop the arid lands in their own home commonwealth.

Idaho up to June 30, 1916, received to its credit from the sale of its public land \$5,680,195, and in the same space of time received from Uncle Sam \$16,786,828. This was again the result of the people of Idaho being active and alert while the people during the same time in California were asleep and making no effort to get what was due to them from this sum of money held by the government.

California up to June 30, 1916, received close to \$7,000,000 from the sale of its public lands, and in the same space of time received but

## DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

"Write for Catalog No. 48"

**BYRON JACKSON IRON WORKS, Inc.**

SAN FRANCISCO

LOS ANGELES

VISALIA

## Perforated Tree Protectors

Why use anything but a PERFORATED PROTECTOR, which allows free circulation of air and sunshine to gradually harden the tender bark. Practically a small LATH HOUSE ABOUT EACH TREE. Protects from Squirrels—Rabbits—Gophers—Hot Sun—Sand Storms—Barking in Cultivation, etc.

We make a number of kinds. TELL US YOUR PEST, and we will tell you what kind to buy. Get our prices. We can save you money.

### COLLAPSIBLE PLANTING POTS

Why not raise your early Tomatoes, cabbage, chili and egg plant for home use or for market. Do you know that you can start

Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in. THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.

When writing advertisers, mention The Cultivator.

\$870,000 for the Orland project and about \$30,000 spent on the Yuma government project, leaving something over \$6,000,000 due to our state from the sale of our own public domain, while by the allotment plan under which other states got their money, we have over \$20,000,000 due to us at the present time.

This money, \$6,000,000, arising from the sale of our own lands, was taken from California by the more alert people of other Western states and has been used by them to complete their own unfinished government projects and was paid out to them year by year since June 17, 1902, and is still being diverted to other states and will continue to be until the people of California put a stop to it by demanding this money for their own use and follow it up by making a vigorous fight until it is turned over to this state.

There never was a time in the history of this state when reclaimed land

was more in demand than at present, as we need the land; our government needs it, and every patriotic man knows that to prepare land for seeding and raise crops to feed our army and our people is as loyal an act to our country as to fight in the trenches of France.

We have 2,000,000 acres of land for which water can be secured to irrigate it, and therefore have no excuse to offer for not making use of the money that is due our state.

The California Irrigation Association is located in the Merchants' National Bank Building, San Francisco, and is back of this work of securing the money due to California in the Mohave River country and at least one new project built in the northern part of this state, the work to commence during the coming year. Northern California will be entitled to two projects providing the cost of either one does not exceed \$1,500,000, or the expense of the two canal systems does not exceed \$3,000,000.

## The Living Plant

Written for California Cultivator By Ernest Branton

**T**HERE is no great gulf existing between animal and vegetable life, as many think, and as all thought a few generations ago. Indeed, if we follow these two great divisions of life down to the lower levels we shall find plants that voluntarily swim about by their own motile power, and animal life that is as stationary as a barnacle on a rock. The differences are really of secondary importance, the greatest being in the different methods of obtaining food.

But even the stationary barnacles or other animal life exhibit some sort of activity to obtain food by causing currents of water to turn their way so that food passes close to the ever-open maw. On the other hand plants in no wise pursue their food but absorb it from immediate surroundings. Even motile plant life does this. While animal life may consume solids, plant life absorbs food only in solution, even the insectivorous plants feed in this manner, extracting from the victims the juices only. In both divisions of life the trend upward marks additional and special organization in the individual. It is often stated that circulation of blood and circulation of sap are conducted on the same system, but this is not true. There is no circulating system in a tree at all comparable with that of the arteries and veins of animals. But all the water required by the leaves does come up from the roots and is delivered to all parts of a leaf by the "veins" thereof.

It is only through its roots that a plant obtains water or food and this it absorbs directly from the surrounding soil. Right there is a rank departure from any likeness to animal life. A short distance behind the tip of every root will be found the actual feeders or root-hairs through which the plant obtains its food. The root hairs are efficient only so long as they remain uninjured. Planters should remember that when these are dried they die and will in no case grow out again. The plant has to make a new lot. If it be in good health and vigor it does this readily. If in poor condition the plant will perish. The change of position might have proven beneficial if care had been observed, even in a weakly individual, and in this respect vegetable and animal life are strangely alike. The powerful "root pressure" is clearly shown

by the distance it forces water up a tall tree. At certain seasons, especially in spring, this pressure forces sap out from a stump for some time after a tree is felled and late pruning often shows it by the profuse "bleeding" of the injured parts. This is a distinct loss of vigor and may be compared with loss of blood in animals. It must also be remembered that in both animals and vegetable life this loss is sometimes beneficial. If this water supply is deficient the leaf area or feeding crop must be correspondingly reduced for there must be found some means of checking the loss of water. Herein is seen the chief reason why we have the "June drop" of oranges, which does not always fall in June. If foliage and fruit does not fall the difficulty must be met in other ways, for the law of supply and demand is relentless and is never defeated.

### Growing Native Plants

The greater number of native plants are benefited by ordinary garden treatment, especially those that grow in damp or shady places or in deep rich soil. But the trees and shrubs of our driest hillsides are not benefited by water and fertilizer except to make them grow faster and this is not always desired.

In the case of Matilija poppies, which I have grown extensively for a dozen years, I cannot say that they have been helped by fertilizer or additional water supply. It is certain that cultivation of the soil is positively injurious. When there is dry weather during the growing season previous to flowering it is undeniable that water is beneficial to any and all plant life. What effect water throughout the year may have upon the following year's growth, through storing of vigor in the roots I cannot say, but careful study has failed to note any. Any garden soil is richer in general plant food than the virgin soil in which this class of plants grow. The question arises, however, does the natural soil contain more special plant food than the garden soil. As a rule it does not. The matter is worth a little study to determine if the soil where a goodly supply of any native plant grows contains any special element that man could easily supply. A plant that seems to resent interference by man to a still greater degree is the yellow tree poppy, *Dendromecon rigidum*. Cultivation has brought speedy death to a majority of these plants when placed in gardens. And I have never seen larger flowers, larger leaves or better condition in any tree poppy grown in the garden than I have seen in the wilds.

As Simple as a Water Wheel

The simplest form of power generation is the water wheel which consists of a series of paddles mounted on a shaft, running in simple bearings and requiring only an occasional oiling.

Like the water wheel, the K-W Magneto owes its reliability to this same, simple construction. The windings (A) are stationary, while the paddle-like rotor (BB) revolves in ball bearings (CC) and generates the current. Like the water wheel the internal parts of K-W Magnetos need absolutely no attention except for an occasional oiling.

There are *no* moving wires, revolving windings, troublesome commutators and brushes, current collector rings, etc., in this patented K-W construction. We thereby eliminate all internal sparking and trouble due to sliding contacts and poor connections. In K-W construction all internal connections are *permanent*.

Don't put up with inefficient, troublesome ignition. Insist upon a

## High Tension MAGNETO

which requires no more attention than a water wheel—a magneto that is as efficient as it is reliable. There is a type for *your* tractor. Tell us the make of your tractor and we can show you how a K-W will allow you to get full power out of the cheaper grades of fuel. Write for a list of K-W equipped tractors—there are 83 models made by 40 manufacturers.

## Citrus Conference

**WILLIAM S. CULBERTSON**, member of the United States tariff commission, assisted by Walter S. Cox, official reporter of the commission, is in California holding conferences with citrus, olive, raisin and nut growers, with poultry people and some manufacturing interests to secure information which will be of value to the commission in a revision of the tariff laws.

The hearings in California began on Tuesday morning in Los Angeles. The first one was attended by representative citrus growers, and explanation of the present condition of the industry, difficulties confronting the producers and items as to costs of production were presented to Commissioner Culbertson. The conference was most informal, the commissioner stating that it was in no sense a hearing; any producer or interested party was permitted to make suggestions or even ask questions of any one who was making a statement.

The Citrus Protective League presented through Secretary Dezell the formal statement of citrus growers. Attention was called to the difficulties of citrus growers, especially of the lemon growers, from such natural causes as the freeze of 1913, the heat of 1917, the losses from insects and fungus troubles, also to the unsettled marketing conditions occasioned in the earlier days of the war.

The greatest obstacle of all confronting the lemon industry at the present moment is not so much the tariff as the question of labor and of increased expense at all points of production, packing and transportation. The labor situation is not only a matter of increased cost but lowered efficiency. The independence of each worker when he considers the possibility of stepping out of any job he may have into another makes it impossible with many of them to secure effective work.

The report went fully into other problems confronting the industry; transportation of box shock and supplies, inability to secure cars in time of stress with a perishable product, the dumping of great quantities of Mediterranean fruit at Eastern seaboard at times.

The cost of production in 1910, as determined by extended investigations made by the league, and shown on a chart issued at the time the investigation was made, was one of the exhibits filed with the commission. As to comparative costs of production in 1918 only approximations were attempted, for no consistent investigation has been made. It was patent, however that they are vastly greater.

Attention was called to the fact that at the present moment lemons are selling at the highest price ever secured. Sales as high as \$14 have been made. This was explained as resulting from dearth of foreigners, caused by shipping conditions, by the hot weather over the East and large purchasing power of the consuming public.

This condition may be materially changed, for shipping conditions will be altered, as may be those of weather and other determining factors. For instance; at this moment on the pliers of New York or on the way across or available for immediate shipment there are 235,000 boxes of foreign lemons "within sight."

George C. Roeding, president of the

state board of agriculture, represented that body at the conference and in addition the citrus growers of Central and Northern California. Northern California sections ship citrus fruits much earlier than the central section. For instance, the Washington Navel shipping in the north may begin around November 15, and the shipping of Valencias early in April. As a lemon producing section Central California has difficulties in the continual coolness of the winter season which prevents blossoming and setting of fruit so as to ripen at a time when it may secure the longer prices of mid-summer shipment. Offsetting this obstacle to best results in the north was given the fact that land and water are much cheaper than in the southern section of the state.

Dr. Coit referred to citrus canker affecting the orchards of Florida and to diseases and troubles affecting California orchards. Frederick Maskew, state quarantine official, called attention to the fact that 1,811,000 citrus trees had been burned in Florida in the effort to rid that state of that trouble. Mr. Maskew also outlined quarantine work as conducted in this state. Dr. Webber of the citrus experiment station brought up the point that the citrus industry in California, which at one time was increasing by leaps and bounds, is now practically at a standstill, or at least increasing very slowly. He referred to the inability to secure fertilizers as one of

the greatest problems confronting the industry.

Participating in the conference were Messrs. C. C. Teague of Limon-eira; C. W. Leffingwell, Whittier; Kenneth MacRae, Rialto; Harry Chase, Riverside; Mr. Wilson of the United States department of agriculture citrus by-product laboratory; L. V. Shepherd, Los Angeles; Stanley R. Pratt of the Mutual Orange Distributors; J. J. Pendergast, Los Angeles, and others.

#### PRUNE PRICES

In order to clear up widespread misunderstanding through abbreviated press reports of the price growers are to receive for the 1918 prune crop, Federal Food Commissioner Merritt announces that the maximum price of eight and one-half cents approved by the United States food administration at Washington meant the average base price for the average prune which the state produces.

The maximum prices on grades or sizes, recommended by the growers and approved by Washington, are as follows:

20 to 30 to the pound.....15 cents flat  
30 to 40 to the pound.....10 cent basis  
40 to 50 to the pound.....9½ cent basis  
50 to 60 to the pound.....8½ cent basis  
60 to 70 to the pound.....8½ cent basis  
70 to 80 to the pound.....8½ cent basis  
80 to 90 to the pound.....8 cent basis  
90 to 100 to the pound.....8 cent basis  
100 to 120 to the pound.....4½ cents flat  
120 and smaller, pound.....4 cents flat

The status of existing contracts will be determined later. Regulations will also be announced later relative to sack test methods which would give the grower the option of securing the advantage of premiums either on sack test or grader test.

Packers and associations are still restrained from buying, soliciting or selling 1918 prunes and will be restrained until official notice is given for them to proceed.

The above prices were agreed upon as fair, based on the increase in the cost of production and light crop conditions, by a committee representing the independent growers of the state and the California Prune and Apricot Growers' Association, Inc., and Merritt. The independent growers were represented on the price fixing committee by E. N. Richmond, W. S. Clayton, Elmer E. Chase, and E. L. Fellows, of San Jose; Frank H. Buck, Vacaville; W. C. Chisholm, Santa Rosa; Jerry Buckley and W. H. Williamson of the Sacramento Valley.

These are the highest prices California producers have ever obtained for their prunes, but through regulation of dealers' profits prices to the consumer will be stabilized.

#### THE CARBURETOR

Continued from Page 743

vice utilizing the partial vacuum produced in the inlet manifold of the engine to lift a supply of the fuel from a supply tank at a lower level. It has two chambers, one into which the fuel is drawn at intervals and the second into which the fuel flows from the first, and thence to the carburetor. The latter is always open to the air so the flow is uniform.

#### Automatic Carburetors

An automatic carburetor is one which adjusts the mixture to accommodate a varying speed of the engine. The suction varies with the speed and if an automatic feature was not provided, the mixture would become too rich with an increase of speed. Most automatic carburetors have a supplementary air valve to dilute the mixture at high speed.

#### Schebler Model "D"

This has a spring loaded supplementary air valve.

Adjust fuel valve for low speed. Adjust air valve for high speed.

#### Kingston Model "L"

Has a submerged nozzle, hence is called a "puddle carburetor." Has no air valve, but has one adjustment, the needle valve.

#### Stromberg Model "H"

Double jet carburetor with auxiliary air valve. Adjust needle valve for low speed and auxiliary air valve for high speed.

#### Master Carburetor

Multiple jet carburetor with a number of openings, furnishing fuel controlled by the throttle. Has a dash adjustment to an air "damper."

#### Rayfield Model "G"

Double nozzle carburetor with auxiliary air valve. Separate adjustment of lever mechanism to provide for low and high speed.

#### Heating

Nearly all carburetors designed for using heavy fuels have some means of heating the air before it reaches the carburetor. Although necessary pre-heating reduces the power of the engine.

#### Oil Engines

In oil engines a hot bulb is often used into which the fuel is fed to produce vaporization.

#### Semi Diesel and Diesel Engines

In these engines usually burning tops or fuel oil, the fuel is sprayed into the cylinder by a small pump each stroke. The amount of fuel discharged by the pump is controlled by the governor.

#### FAWCETT HOME

Prof. H. S. Fawcett who has been at Baltimore, Maryland, on a year's leave of absence doing special work, is again at home at the Riverside Citrus Experiment Station.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## MAKE JOHN DEERE SEED BEDS BEHIND YOUR TRACTOR

THERE is a distinctive quality in John Deere seed beds that makes them especially satisfactory. Farmers everywhere have recognized this quality for many years. Wherever you go in farming sections—in all kinds of soil—you will find John Deere seed beds.

It is just as easy to make the thorough John Deere seed beds as it is to make seed beds that are "just fair".

You can make them behind your tractor with a John Deere Tractor Plow and a John Deere Tractor Disc Harrow.

From your John Deere dealer you can get the size of each of these seed bed-makers to suit your tractor. See him, and then do what farmers everywhere have found most satisfactory—make John Deere seed beds.

### JOHN DEERE TRACTOR PLOW

Sizes 2, 3 and 4  
Bottoms

Genuine John Deere bottoms—the world's standard for 80 years because of their better seed bed-making and wearing qualities. Bottoms reach full depths immediately and stay in the ground at full depth while plowing. High and lever power lift—always dependable—no chains or sprockets about lift mechanism. Quick detachable shares—strong, close-fitting and time-saving. Beams guaranteed not to bend or break.

### JOHN DEERE TRACTOR DISC HARROW

#### Double Action Pony Tractor Disc Harrow

Exceptionally strong, light draft and flexible. Double bar gang frames with heavy tie plates. Strong, high-arched connections between front and rear sections—quick turns are easily made. Pull of rear section is direct from center of disc bearings. Patented oscillating scrapers can be locked either on or off. This harrow is adapted for any make of light tractor. For heavy tractors get the John Deere Double Action Heavy Tractor Disc Harrow.

Sizes

Make Better Seed Beds

## Parasites Control Cotton Aphis

By A. W. Morrill, State Entomologist of Arizona

**D**URING the past two weeks young cotton plants in many fields in the Salt River Valley have appeared to be in great danger of being destroyed by small greenish or greenish black insects known as the cotton aphis. The same species attacks and sometimes destroys melon vines and is perhaps better known as the melon aphis. It occurs everywhere in the United States where cotton is grown but is not ordinarily of much importance as a cotton pest on account of the effectiveness of its natural enemies, particularly a black wasp-like parasite.

There are two forms of the adult, winged and wingless females. Males are not known. The body of one of the full grown insects is about a fifteenth of an inch long. The folded wings in the case of the winged form extend approximately another fifteenth inch beyond the end of the body. The migrating or winged adults spread into the cotton fields from mallow and other weeds which have remained infested throughout the winter. Eggs are laid on the young cotton plants soon after they come through the ground. These soon hatch and the nymphs in the course of a few days develop into wingless adults.

These are each capable of giving birth to six to ten young per day. As these in turn become full grown in less than a week and are ready to reproduce it is apparent that no crop could long survive if such an increase were unchecked.

Fortunately, wasp-like or hymenopterous parasites, lady bugs, lace wing flies or chrysopas and predaceous flies known as *Syrphus* flies are very effective as a rule in preventing undue multiplication. On April 22 the writer visited several cotton fields near Chandler where severe damage by the aphis was threatened. No signs of natural enemies were found in two fields and only slight traces of them in the other fields. Samples of the infested plants were collected and brought to the office of the state entomologist in Phoenix to give the parasites, if present, a chance to develop. By the end of the week adult parasites appeared in large numbers from the aphis on these plants. It was found that out of 85 specimens of aphis present on four small plants 49, or 57 per cent, had been parasitized.

Before the death of the parasitized aphis occurs the body of the insect turns light brown in color and becomes almost globular in form. The insect before dying attaches itself

rigidly to the leaf on which it was feeding. These parasitized insects and the empty shells which remain after the adult parasite emerges are very conspicuous and a farmer should learn to recognize them.

In the Chandler fields which have been referred to the aphis is doomed, practically speaking, to extermination before it can do any appreciable damage to the cotton. Each adult female of the parasites is capable of destroying around two hundred aphis individuals. That is, each adult parasite will parasitize or deposit an egg in the body of each of two hundred or more specimens as long as the supply of aphis holds out.

The effectiveness of parasites, lady birds and other natural enemies of aphis, is dependent on the weather.

Cold weather during the crop growing season is unfavorable for the natural enemies and therefore favorable for the aphis. During warm or hot weather the parasites are capable of multiplying so much faster than the aphis that the latter are relatively unimportant among cotton pests. The natural enemies of this species of aphis for some reason are much more reliable in the control of the pest on cotton than on melons and other crops. Owing to this indirect relation of the weather to the effectiveness of the parasites it is a common belief among farmers and gardeners that the hot weather destroys the aphis. As a matter of fact the aphis will thrive in our hottest midsummer weather and do much damage if for any reason the parasites and other natural enemies are not active.

## The Woman's Land Army

**T**HE plan of the Woman's Land Army for bringing together employer and women workers is as follows: According to R. L. Adams, state farm labor agent, under whose advice and direction the land army is working, there are about 19 counties north of the Tehachapi which will probably experience a shortage of labor during July, August and September. In each of these counties the Woman's Land Army has named a local representative of the organization,

whose business it is to work with the county farm adviser and his assistants, the federal and state employment bureaus, and the farmers, orchardists and canners themselves in the matter of calling out recruits and placing them where they are needed.

Here is a summary of the facts contained in their printed leaflet entitled "Help for the Farmer." First let him get in touch with the local representative of the Woman's Land Army through his county farm adviser, or through the federal and state employment bureaus, or through the central office of the Woman's Land Army located at 521 Underwood Building, San Francisco,—they are all working together. When he has stated to this representative the nature of the job, the time, place, probable duration of service, rate of pay and number of workers desired, she will endeavor to fill the orders from the local recruits that she has enrolled, women who will live at home and "commute" to their work by bus, car, auto, etc., thus avoiding the development of the housing problem.

If, during the peak-load harvest time, this field representative of the Woman's Land Army reports that every available local recruit has been put to work and that there is still a demand for workers, then the central office in San Francisco will endeavor to send in to the orchardists or canners asking for them, groups or units of women enrolled in their reserve army, that is provided Professor Adams or the local farm adviser approves the call.

These units can be in any number, from ten to 100. They can live in small groups on individual ranches and give their services to that ranch exclusively,—or better, a large unit can be established in a centrally located camp from which they can hire out by the day to the surrounding farmers and orchards.

If the farmers of the neighborhood will club together and provide them with simple but sanitary living quarters with bathing facilities, and an adequate cooking outfit, the women will take care of themselves with no trouble or responsibility to the farmer's wife. A vacant house, abandoned hotel or tent camp would prove practicable. Each large sized unit takes with it its own cook and supervisor. This supervisor is a trained executive, the medium for all business transactions between the women and their employers.

Women Land Army workers will not be sent into any field or agricultural labor with the idea of undercut-

**T**HE American farmer produces more per man than any other farmer in the world. Using labor-saving machines, he produces record crops with less hired help than is required under any other system. Therefore, in the present crisis, with help so scarce, every farmer should use the most efficient farm machines he can get, the only kind that can be depended upon to make the necessary increase in production.

The International Harvester Company of America markets the full line of high-grade machines listed in this advertisement for disking and harrowing seed beds; planting and cultivating crops of all kinds; cutting, making and storing hay; cutting, binding and threshing small grains; harvesting, husking and shelling corn; shredding corn fodder, filling silos, fertilizing fields; skimming cream; and grinding feed. It sells efficient farm power machines, engines and tractors operating on the cheapest fuels a farmer can buy. It provides wagons and motor trucks for all kinds of farm hauling.

Many of these machines have been used by American farmers for close to seventy-five years. They have helped to establish the standing of the American farmer. They are better today, more efficient and more economical than ever before. In many cases, one or another of these machines will solve the hired help and farm power problems on individual farms.

International machines are sold through ninety branch houses and over thirty thousand local dealers. Any customer can place an order, or command the services of this organization, by a telephone call to the dealer, or a visit to the nearest town.

It is important this year that all orders for machines be placed as early as possible, preferably months in advance. See the local dealer, or write us about the machines you are going to need this year, and do it now.

### International Harvester Company of America

(Incorporated)

Billings, Mont. Crawford, Neb. Denver, Colo. Helena, Mont.

ting man labor or breaking strikes. While in the field or orchard the minimum wage for all land army workers will be 25 cents an hour with one and one-fourth rate for overtime. After their learning period is finished, if they wish a piece work basis they ask to be paid the going wage of the district.

It has been felt that this organization, with its semi-military and patriotic stimulus to recruiting its very effective economic and industrial machinery and the substantial backing and recognition it is receiving from men prominent in the business world of California, should prove to be a real factor in the solving of our summer labor problem.

#### BEAN CULTURE

The most complete account of bean culture in California has been made in Bulletin 294, "Bean Culture in California" by G. W. Hendry. It has an appendix in which Composition of California Varieties of Beans by M. E. Jaffa and F. W. Albro is given. In addition E. R. de Omg gives an account of insects and other enemies of beans.

In 1917 California produced on 558,000 acres, 8,035,000 bushels of dry beans, constituting 44 per cent of the entire crop of the United States, and exceeding by 4.78 per cent the combined output of the five next important states, Michigan, New York, Colorado, New Mexico, and Arizona.

California's 8,000,000 bushels last year made by far her greatest production. It exceeded that of 1916 by nearly two and a half million bushels. Other bean states last year produced as follows: Michigan, 3,514,000; New York, 1,575,000; Colorado, 1,467,000; New Mexico, 958,000; Arizona, 152,000; or a total production for the United States of 15,701,000 bushels.

To produce the 8,035,000 bushels required 558,000 acres. This was divided as follows: Southern California, 314,000 acres; San Joaquin Valley, 45,000; Stockton delta, 30,000; Sacramento Valley, 130,000; Central Coast counties, 30,000; and scattering sections, 9,000. Fifteen varieties are grown in this state. The production of these varieties in 1917 was approximately as follows: Limas, 1,224,000 100 pound bags (price for 1917 not given but average December wholesale price, 1912-1916, \$5.40); Pinks, 1,200,000, \$4.10; Small Whites, 900,000, \$5.50; Lady Washington, 610,000, \$4.95; Blackeye, 300,000, \$3.85; Cranberry, 150,000, \$4.65; Bayo, 125,000, \$4.60; Garbanzos (not given for 1916-1917 production, 90,000 bags) \$3.70; Red Mexican, 135,000, \$4.60; Red Kidneys, 20,000, \$5.90; Teparies, 100,000, \$2.50; Horse, 75,000, \$2.75; French White, 12,000, \$4.90; Spotted Red Mexican, 500, \$3.00; Henderson Bush, 116,000 (no price given). No explanation is given for the exceedingly low average price of Teparies, but we may add that last year the Tepary came to its own and commanded far better prices, in fact, last year's sales would have greatly increased the wholesale average on all varieties.

One valuable feature of the bulletin is the colored plate showing California field beans actual size.

#### WHITEWASH

Whitewash is the cheapest of all paints and for certain purposes it is the best. Lime, which is the basis of whitewash, makes a very sanitary coating and is probably to be preferred for cellars and the interior of stables and other outbuildings. The following directions for making whitewash are taken from "White Paints and Painting Materials," by W. G. Scott:

##### Ordinary Whitewash

This is made by slaking about ten pounds of quicklime with two gallons of water.

The lime is placed in a pail and the water poured over it, after which the pail is covered with an old piece of carpet or cloth and allowed to stand for about an hour. With an insufficient amount of water, the lime is "scorched" and not all converted into hydrate; on the other hand, too much water retards the slaking by lowering the heat.

"Scorched" lime is generally lumpy and transparent, hence the use of the proper amount of water for slaking and an after addition of water to bring it to a brush consistency.

##### Factory Whitewash

Interior: For walls, ceilings, posts, etc.

(1) Sixty-two pounds (one bushel) quicklime, slake with 15 gallons water. Keep barrel covered until steam ceases to rise. Stir occasionally to prevent scorching.

(2) Two and one-half pounds rye flour, beat up in one-half gallon of cold water, then add two gallons of boiling water.

(3) Two and one-half pounds common rock salt, dissolve in two and one-half gallons of hot water.

Mix (2) and (3), then pour into (1) and stir until all is well mixed.

This is the whitewash used in the large implement factories and recommended by the insurance companies. The above formula gives a product of perfect brush consistency.

##### Weatherproof Whitewash

Exterior: For buildings; fences, etc.

(1) Sixty-two pounds (one bushel) quicklime, slake with 12 gallons of hot water.

(2) Two pounds common table salt, one pound sulphate of zinc, dissolved in two gallons of boiling water.

(3) Two gallons skimmed milk.

Pour (2) into (1), then add the milk (3) and mix thoroughly.

##### Lighthouse Whitewash

(1) Sixty-two pounds (one bushel) quicklime, slake with 12 gallons of hot water.

(2) Twelve pounds rock salt, dissolve in six gallons of boiling water.

(3) Six pounds Portland cement.

Pour (2) into (1) and then add (3). Note: Alum added to a lime whitewash prevents it rubbing off. An ounce to the gallon is sufficient.

Flour paste answers the same purpose, but needs zinc sulphate as a preservative.

Molasses renders the lime more soluble and causes it to penetrate the wood or plaster surface; a pint of molasses to five gallons of whitewash is sufficient.

Silicate of soda solution (about 35 degrees Baume) in the proportion of one to ten of whitewash produces a fireproof cement.

A pound of cheap bar soap dissolved in a gallon of boiling water and added to about five gallons of thick whitewash will give it a gloss like oil paint.

An old receipt for whitewash, issued by the lighthouse board of the

treasury department, said to be very good for outdoor exposure, is as follows:

Slake half a bushel of unslaked lime with boiling water, keeping it covered during the process. Strain it and add a peck of salt, dissolve in warm water; three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of powdered Spanish whiting and a pound of clear glue, dissolved in warm water; mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace; and when used, put it on as hot as possible with painters or whitewash brushes.

The washes which contain milk, flour, or glue are not to be advised for use in damp, interior places, owing to danger of decomposition of the organic matter. For such locations it is better to use one of the formulae containing none of such ingredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as in the case with an oil paint.

A good whitewash recommended by Dr. Colt for young trees, or where they have been heavily pruned is what is commonly known as California tree whitewash:

Quicklime ..... 30 pounds

Tallow ..... 4 pounds

Salt ..... 5 pounds

Water enough to make the mixture flow freely.

Porcelain-ware

Inferior insulators, like cheap porcelain-ware cups, break under sudden changes of temperature

Stone-ware

Stone-ware withstands extremes of heat and cold. That is why Vitristone insulators do not break

## Why 92 out of 100 spark plugs fail

*Insulators of inferior material cannot withstand modern engine conditions*

OUT of 100 discarded spark plugs, taken at random, careful examination by experts showed that 92 were rendered useless by breakage of the insulators.

Both laboratory and road tests have proved this insulator breakage is due almost entirely to inferior material.

Inferior insulators cannot withstand the severity of modern engine conditions. In spark plug service they are subjected to intense heat—2000° to 3000° F.; rapid changes of temperature; high speeds; and hammer-like blows of compression. It is only natural that they should crack and break down.

Last year 42,000,000 plugs were thrown away, largely due to breakage of inferior insulating material.

#### The development of Vitristone

After eight years of experiments in the Red Head potteries, spark plug experts perfected an insulating material that would not crack under

Chalky, inferior insulators break down under heat. Rugged, crystalline Vitristone withstands the severest conditions

the heat and vibration of the engine—the greatest advance made in spark plug construction in the past ten years.

Vitristone—the new insulator—is an artificial stone. Its rugged, crystalline structure is unaffected by rapid changes from extreme heat to extreme cold. It withstands the most intense vibration.

#### Built for years of service

Rigid tests insure gas-tightness and insulator efficiency in all Red Head plugs. If a Red Head misses, clean it, and nine times out of ten it will fire 100% right. It is easy to clean. Don't wait till your spark plugs crack and miss fire. Put a full set of Red Head plugs in your engine today. There is a Red Head plug for every requirement.

Your dealer has Red Head plugs in stock or can get them for you. If he does not, write to us for the name of the nearest dealer who can supply you.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Feeding Smutty Oat Hay

I have 15 acres of oats that I will make hay of. It is very smutty. Is there any treatment I can give it as I put the hay in the barn so it will not be injurious to the horses that eat it? Will it kill horses? — C. C. T., Squaw Valley.

Hay made from very smutty oats is generally very dusty. For this reason, or perhaps because of the effect of the smut itself, it is likely to cause heaves in horses and may give rise to bronchial troubles. Such hay had better, therefore, not be fed to horses. It can probably be rendered a safe horse feed by moistening it slightly with water as it is placed before the horses. So far as is known, there is no danger from feeding such hay to cattle, however, and the safer method would be to feed it that way, or, if fed to horses, to feed it in moderate amounts only.—F. W. Woll.

### Garbanzos and Horse Beans

What do you think of the advisability of planting Horse beans or Garbanzos as a winter crop with grain? Has this been tried successfully? Were the beans sowed broadcast and harrowed in or put in with planter? Would early fall planting be advisable for the beans?—Subscriber, Modesto.

We would not recommend planting Horse beans or Garbanzos with grain. Neither the beans nor the grain would give best results when planted together, while if grown separately they would both give good crops. The Horse beans may be planted in early winter in drills. The Garbanzos will be better planted in early spring in drills.—D. F. R.

### Bermuda Onions

I am thinking seriously of putting out about one-half acre of White Bermuda onions and would like to know whether it would be advisable to plant the seeds sometime during this summer, raising small onions by fall and then setting the green onions in rows four to six inches apart in the row, and rows 18 inches apart. I am anxious to know whether or not they will do well during the winter, and if White Bermuda would be as good a variety as I could get? — Subscriber, San Bernardino.

By planting the seed at once sets could be grown which would be ready for transplanting in October. Or the seed could be grown in August and the young plants transplanted to the field when seven to nine weeks old in rows as you suggest. The Bermuda varieties are the ones grown in the Imperial Valley. The seed is sown from August to October and grown through the winter. These ripen in the spring earlier than any other variety.—D. F. R.

### House Fleas

Can you tell me how to get rid of fleas which seem to keep headquarters in an old milk house now used for tools and storage?—Subscriber, Glendora.

Use dry slacked lime freely about the infested room. Hosing down and washing the dust away is a help. If the lime is used slack by adding only sufficient water so it will slack into a dry powder. As insect eggs are scattered about where there is decaying vegetable matter and dust it should be removed so far as possible. In this cleaning up process relief may be

had for the operator if a liberal supply of buhach or insect powder is sprinkled into stockings and underwear before going into the room.

### Ants in Lawn

Can you give a method for exterminating ants in the lawn and yard?—Subscriber, Eagle Rock.

Mr. Neff in a former Cultivator gives the following formula for destroying ants: "Three tablespoons honey, and tartar emetic the size of a lima bean. Mix and put in two or three saucers and place where ants are proving troublesome."

### Morning Glory

I have wild morning glory in my prune orchard and want to know if distillate will kill it without injuring the trees. If not, what remedy can I use?—Subscriber, Santa Rosa.

There is only one satisfactory method for the eradication of morning glory and that is by use of the sharp weed cutter of the straight bar type. Shallow cutting is all that is necessary but it is best to cut at least twice every week. If this campaign is persistently followed for a few weeks, never allowing a green leaf to appear above the surface of the ground, the pest can be killed. Distillate over the leaves when sun is giving its greatest heat will kill some of the plants, but cultivation is more effective.

### Poison on Cabbage

Would there be danger from poison by eating cabbage that had been sprayed several times liberally with lead arsenate? Would it affect poultry if they ate the leaves?—Subscriber, Long Beach.

Presumably not. If the cabbages are hosed over before being picked there is no danger. If the spraying was properly done even the hosing would not be necessary.

### Aphis

What can be done for aphis on an awfully run-down place? Trees have been sprayed once but are still covered with them, also all the vegetables. What shall I use for spraying orange trees and when?—Subscriber, Downey.

Spray the trees with tobacco extract, either by using tobacco stump or cigar factory refuse and steeping one pound in one gallon of water and reduce by adding three gallons more of water. Or a simpler way is to purchase the nicotine sulphate, 40 per cent strength and dilute at the rate of one pound to 100 gallons of water. Then be sure that all weeds or unnecessary plants are eradicated as they afford breeding ground for more aphis.

### Rose Leaf Blight

Can you tell me what is the trouble with my roses? As fast as the buds burst they seem to dry up. Is this rose blight? If so can you tell me what to do for it? — Subscriber, Elk Creek.

This is rose leaf blight, a fungus disease directly affecting the foliage. If it in any wise directly affects the blossom I am not aware of it, but it is a disease very hard to combat and is closely related to the leaf blight of the strawberry and treated in the same manner. But strawberry growers are much puzzled in seeking control over this blight. I cannot precisely define the trouble stated but believe sulphuring would ameliorate conditions. It may be that spraying with Bordeaux mixture would also aid.—E. B.

QUICK AND ECONOMICAL TRANSPORTATION

## Replace Teams With Nash Trucks

If horses were not so scarce and so high in price, Nash trucks would still be an economy hauling your loads of wheat.

Of much greater capacity and speed than the team and wagon, Nash trucks in your service not only cut down the number of trips to town in busy harvest time but release valuable harvest hands for more important work. For one Nash two-ton capacity truck will do the work of several teams and wagons, do it better and do it at less cost.

You can leave home later and get back earlier. Measured by the clock, the distance to town and back is less by hours. And the Nash truck does not have to rest, but can haul as far and as often as necessary.

The Nash two-ton capacity rear driven truck is particularly adapted to long and heavy hauls because it, like all Nash trucks, is equipped with an M. & S. automatic locking differential. When, for any reason, one driving wheel loses traction momentarily, its mate gets practically all the power and drives the truck ahead out of difficulty.

This lets Nash trucks get through where other trucks without this important feature cannot go.

Let a Nash transportation expert tell you the many ways a Nash truck can save money hauling your loads.

## Field Notes from the Live Stock Men

Beauty Girl Pontiac Segis is indeed a "beauty girl." If we had a few more like her the milk question would be in a fair way to be solved. This pure-bred Holstein heifer has produced in one year 1112.48 pounds of butter and 24,923 pounds of milk. With this enormous production to her credit she becomes the second highest record heifer for butter production and the highest record heifer in the world for combined milk and butter production. Beauty Girl Pontiac Segis is the highest record daughter of King Segis Pontiac Count. The daughters of this great sire hold more world's records for milk and butter in the prize division than do the daughters of any other sire living or dead. The dam of Beauty Girl Pontiac Segis is Princess De Kol Beauty Girl. This champion heifer was bred by Arden Farms, St. Paul, Minnesota, owned by Senator J. M. Hackney, and made all her records there.

Rosalie of Woodend 39337 is the first class leader to be bred at Woodend Farm, Mound, Minnesota. She finished on February 8 her second yearly test with 13,611.7 pounds of milk and 768.50 pounds of fat in class B, giving her eighth place in the class. In her test in class F she held out so well that it was thought best to retest her. Her present record of 768.50 pounds marks her as the highest producing daughter of Imp. Cora's Governor of Chilmark 8971 and she is his third daughter to pass the 700 pound mark. Another daughter, Antoinette of Chilmark 24816, started on retest in class A one day ahead of Rosalie of Woodend 39337 and escaped the 700 pound mark by only one and five one-hundredths of a pound—her record being 14,017.7 pounds of milk and 698.95 pounds of fat. Another 700 pound daughter of Imp. Cora's Governor of Chilmark 8971 is Caroline of Chilmark 24812, owned by G. W. Wilder of Colton, California, with a record of 15,185.3 pounds of milk and 722.97 pounds of fat in class A.

Ninety-six Jerseys averaged \$630 at Cooper sale at Coopersburg, Pennsylvania, on Decoration Day. The total number of animals sold was 96, for an aggregate of \$60,555. Fifty-one cows sold for an average of \$787. Thirty-two heifers sold for an average of \$412. Twelve bull calves averaged \$579. The only aged bull offered brought \$250. The great cow, Vermonia, was withdrawn when a starting bid of \$4000 was not to be had. T. De Witt Cuyler, the owner of White Horse Farms, Pennsylvania, was the leading buyer. In addition to paying \$2700 for Pretty Jersey Belle, the top-price cow of the sale, Mr. Cuyler bought nine other head that made up the total of \$11,350 for his purchases. Pretty Jersey Belle was a winner at the Royal Show on the Island of Jersey, and also has an official butter record.

The Hood Farm sale at Lowell, Massachusetts, on June 1 established new records for the sale of American-bred Jersey cattle. The leading cow was Sophie's Agnes, a wonderful cow, with good, clean lines and exceptional milk machinery. She already has two Register of Merit records as follows: 10,171.4 pounds milk, 619.89 pounds fat at three years, three months; 14,149.7 pounds milk, 834.88 pounds fat at four years, nine months. She is now on test and promises to exceed the record of her granddam, Sophie

19th, the record holder of the Jersey breed and of all breeds when long distance production is considered. "Agnes" was quickly bid to \$9000, and was knocked down to Ayredale Stock Farm, Bangor, Maine, for \$10,099. It was evident that the buyer wanted to beat the record price paid for a Jersey which was established only a few weeks ago. The ringside considered her a bargain at this figure, however.

The next highest price was obtained when three sons of Sophie 19th, one by Sophie's Torono, one by Champion Torono's Son, and the other by Sophie's Bertha's Son, were led into the ring. E. C. Lasater of Texas paid \$7500 for a choice. He selected Sophie 19th's Tormentor by Champion Torono's Son.

Tilly Alcartra still continues on her merry way. Last week she milked 114 pounds in one day and did not fall below 110 pounds any day. At present, in her fifth month, she is going over 20 pounds milk per day above the corresponding days of her world's record year and is testing higher than ever before. Not the least of the wonders of her present record is the fact that she is not receiving an ounce over 16 pounds of grain in her ration daily, completely upsetting in practice the theory that a cow must receive a given number of pounds of grain to a certain number of pounds of milk yield.

Wm. T. Miller, Ripon, unquestionably secured one of the many real bargains in the fourth Sacramento sale when he bought the heifer A. W. P. Princess Cornucopia from the Bonita Stock Farm consignment for the modest sum of \$425. She is a daughter of the richly bred proven sire, Admiral Walker Prilly and is out of a 25.97 pound dam that made 17,516.6 pounds milk and 847.55 pounds butter in one year as a four year old. She is also heavy with calf to the 32 pound sire Supreme Glista Pietje, and is herself a most promising individual.

The N. H. Locke Company Sale of registered Jerseys has been postponed from the original date June 27 to Saturday, July 6. The catalog of the big sale is now on the press and will be ready to mail out about June 25. California Breeders Sales and Pedigree Company, Sacramento, which manage the sale, report that if inquiries count for anything there will be breeders in attendance from long distances. An unusual feature of the sale is the fact that there are 40 registered Jersey bulls catalogued for sale, more than half of them ready for service, including many bulls of show quality and out of the greatest producing cows in the herd. The large number of bulls to be sold makes it a foregone conclusion that many of them will go at bargain prices, and breeders and dairymen will no doubt be on hand in numbers to take advantage of the condition.

A. W. Morris & Sons' Sale of 125 registered Holsteins has been postponed from the original date of July 11 to Thursday, July 25. The catalog is now in preparation and shows a wonderfully well bred lot of cattle that will be sold under conditions which do not promise anything but very moderate prices. Three 30 pound cows, three cows above 1000 pounds butter in one year, three sisters to Tilly Alcartra, are only a starter to the entire list in the sale. Of the total offering at least 100 head will be cows, and upwards of 75 per cent of them are bred to King Mead of Riverside and Prince Gelschê, Walker.

Your need of a  
**DE LAVAL**  
CREAM SEPARATOR  
is greater right now  
than ever before

These are the days of the full milk pail.

But if you are trying to get along without any cream separator, or with an inferior or half-worn-out machine, the more milk you get the more cream you lose.

And no farmer can afford to lose even a little cream when butter-fat is selling at from 40 to 50 cents a pound.

With butter-fat at present prices, and our country begging us to stop waste, "cream slacker" methods of skimming milk must go.

Get a De Laval right away and put all the cream in the cream can.

There is no other cream separator that can compare with the De Laval in clean skimming, capacity, ease of operation, freedom from repairs and durability.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

## Draft Horse Production Has Declined

By Wayne Dinsmore, Secretary Percheron Society of America

Horse production has been greatly reduced in the past two years. Buyers who are much in the country report that there are very few foals in sight this spring and not many yearlings. This is borne out by field investigations made the last week of May, 1918, by the Percheron Society of America. While some communities have kept up fairly well on horse production there has been a tremendous decrease as a whole. Thousands of farms in the corn belt states have not enough young horses coming on to supply their own requirements for replacement. Instead of having surplus to sell, they must buy.

There is a shortage in the world's supply of draft horses. War interfered with horse breeding operations in France and Great Britain and drew heavily on their existing supply. The real lack of heavy teams has been felt most acutely in the past ten months.

### Few States Produce Surplus

It must not be forgotten that the area in which draft horses are produced in such numbers as to provide a surplus over local needs is very limited. The United States is the only nation in the world producing any surplus of this kind, and only a few states in the Union have the foundation from which to rear a surplus of heavy horses. The states east of Ohio and south of the Ohio River do not produce enough draft horses and mules to supply their own farm needs; and the same is true, so far as grade draft horses are concerned, of all the states south of Kansas or west of Nebraska. Ohio, Indiana, Illinois, Iowa, Missouri, Kansas, Nebraska and the Dakotas are the only states producing a surplus of heavy draft work animals, and only four of these produce any considerable surplus of real drafters. These few states of the Middle West must produce draft horses to supply the world.

On any well managed farm enough colts should annually be reared to make it possible to keep farm work going at maximum efficiency and to render feasible the sale of horses sev-

en or eight years old. This eliminates depreciation and reduces losses by death to less than one-half of one per cent. If horses are produced as they should be on our farms, appreciation rather than depreciation in value will result.

We are being urged to increase the production of foodstuffs by better crop methods and increased acreage; but it must not be forgotten that the existing need for such increased production will last for several years, and without abundant horse power on our farms our desires will be set at naught. It is folly to permit our supplies of horses to be reduced and then seek to fill the gap with tractors, for every man capable of working on tractor manufacture is far more urgently needed in the shipyards, gunships and munition works where trained mechanics must be had in ever increasing numbers. It is up to the farmers of the central west to see that draft horses are produced in sufficient numbers to make it possible to divert these trained steel workers into the shipyards and munition works without limiting our farm power in any degree.

### Horse Power Essential to Low Production Cost

Horses—big horses and plenty of them—have made it possible for the American farmer to produce more per capita employed on farms, than the men of any other nation. The yield per acre has not been as high as in countries where laborers cost but a few cents per day, but the total yield and the high yield per man stands to our credit. The best informed farmers and horsemen in America are united in declaring that increased draft horse production is more urgently needed, and needed now.

From the standpoint of your pocket book, your need for farm power, and your desire to do all you can to aid in winning this war, you should breed draft horses and encourage others to do likewise. Percherons are the seed stock which must be had in abundance to carry forward this increased production of drafters. Care for them well.

## Fill the Silo

Written for California Cultivator

**P**RESUMABLY the silo crops are planted and the silo is either constructed or planned by this time. But its filling may not be planned, so, as a suggestion, may we not refer to the fact that some dairying neighborhoods have united in purchasing cutter and equipment for filling. In the present labor situation the neighborhood "bee" proves entirely satisfactory.

Ten acres of corn will produce approximately 100 tons of silage; it will feed 30 head of cattle 180 days.

Approximately 100 tons of silage equals 33 tons of alfalfa hay. Thirty-three tons of alfalfa hay is worth—but the dairyman has figured this often enough to know it's worth some money. The 100 tons of silage is worth, or will cost to grow and place in the silo ready for feeding, say around \$2.00 per ton, or, with labor at present enormous profits, we can say \$3.00 per ton, and still, value for value, corn silage and alfalfa carefully compared shows the silage to be far the

cheaper. In fact, some dairymen who are careful calculators estimate that with moderate priced silo the saving in feed costs will cover construction of a silo the first year of its use. But a year like the present where every acre is expected to do its utmost, and, still more, a year like this when the dairyman, the beef feeder, and even the pork producer finds feeds beyond all reasonable cost, he may well consider the value of his own time and acreage in producing this cheap feed.

Regarding silage the New York college of agriculture says:

"The usefulness of silage is not confined to dairy cattle. It is of great value to stock which would otherwise be wintered on dry roughage. The thrifty condition of animals thus fed is a guarantee of economical returns. The judicious use of silage makes it possible to keep more stock on a given area, to balance nutrition and thereby to increase the feeder's profits. For growing, wintering and fattening beef cattle, no roughage may be of more value than silage if proper-

**PURE BRED** **REGISTERED HOLSTEINS**

## King Korndyke Pontiac

grows in popularity around our place as those splendid calves continue to be dropped to his service.

We know that you too would class him as highly as we do if you could see the beautiful sons and daughters of his that we now have in the herd.

None of his daughters are for sale, they will be kept right here and developed, but we have a few of his sons that will fit your herd and pocketbook.

You owe it to yourself to investigate this wonderful young sire, for his blood would mean much if introduced into your herd through one of his sons, and we are proud of the dams of these young fellows.

Visit the farm if you can, but get in touch with us some way and find how reasonably we offer these good young bulls and what liberal terms we are offering.

## Prince Gelsche Walker Korndyke

is shown below. His blood should nick particularly well with that of King Korndyke Pontiac, and we are making the cross in our matings.

## Santa Anita Rancho Anoakia Breeding Farm Registered Holsteins

Depth of body is a prime requisite in the high producing dairy cow, and is especially desirable when found in combination with other outward evidences of dairy quality. Great deep bodies are outstandingly characteristic in the offspring of

## Merci Lad Korndyke Burke

our senior herd sire, who is by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, 31,034.1 pounds milk and 1201.00 pounds butter in one year, the first cow in California to produce that amount of butter in one year.

We have a few of his sons, out of good record dams, for sale.

Inquiries or orders by mail will receive careful and prompt attention.

**SANTA ANITA RANCHO**

Anita M. Baldwin, Owner

**Santa Anita, Cal.**

W. H. Taylor Supt.

ly used. In combination with coarse roughage it keeps the bowels regulated and the animal in readiness to respond to change in feeding designed to promote growth or finish for the block. Cows do not age more rapidly, lose their teeth sooner nor fail to breed more regularly because of the use of silage.

"There is no better assurance that silage is without detrimental effect on the milk of a dairy cow than the fact that the large milk companies encourage the use of the silo among their patrons. Consumers are likely to prefer milk from cows thus fed."

The United States department of agriculture, says:

"Silage is a quick finishing roughage in that it produces large daily gains, a glossy coat and a soft, pliable skin. It can be used to advantage at times for carrying cattle for a longer

period so as to pass over a time of depression in the market or to carry the cattle along in a thrifty condition so that they can be finished at a later period. The theory that silage fed cattle shrink very heavily in shipping to market is erroneous. For 36 hours previous to shipment nice, bright hay should be substituted for the silage in the ration. Silage-fed cattle usually make more desirable carcasses than cattle fed a dry ration. Calves may be fed silage with safety when they are about three or four months old."

According to the University of Arizona college of agriculture the feeding value of one ton of corn silage, compared with other succulent crops is as follows: 1.5 tons sugar beets, 1.8 tons rutabagas, 1.8 tons carrots, 2.2 tons turnips, 2.4 tons mangels, 1.4 tons parsnips.

## Tales of a Traveler

Written for California Cultivator By C. A. Briggs

All things hum in Humboldt County. Men and bees reap nature's bounty, gather cash and gather honey, everybody's making money. No one there is living hard, measure rainfall by the yard, green grass grows the year around; milk checks just like money found.

A nationally known bulb grower and potanist is Carl Purdy of Mendocino County. He is well known practically everywhere but in California, making true again the old truth "that a prophet is not without honor save in his own country. California should wake up to what California and Californians are doing. Perhaps you might make a dollar if you woke up. Does that hit you?

"Fred" Johnson, that "feller" over in Napa County has got a number of just the very best Duroc-Jersey pigs it's ever been my good luck to see. Better look for 'em this year at the state fair. You'll have to go some if you beat 'em.

As fine a field of wheat as I ever saw will help beat the Germans this year, just beyond Napa on the road to Sonoma.

Anchorage Leader 5th, a son of Grand Leader now on Fair Oak Ranch, the home of Wm. T. Chapple of Willets, is an especially promising young boar and shows the type of his "dad."

## Care for the Sheep

At this time of the year maggots are prevalent and foxtail is becoming dry and troublesome, and the young sheep farmer should see his flock once a day. A beginner may not be fully aware of these minor ailments, and by reason of field work he may neglect his flock and incur losses.

Maggots are the result of eggs laid by the blow fly on a wet, foul, or bloody place on the wool, the most common place of infestation being about the rear when filth and moisture accumulate. The eggs hatch in a few days and the larvae crawl down and irritate the skin; this attracts more flies and the sheep may soon be alive with maggots spreading all through the wool.

When a ewe is twitching at the dock and seems restless you may be certain that she is infested by maggots. In very bad cases sheep will be found lying down separate from the main flock.

The treatment is simple, the important part being to get at the trou-

ble sure marks 'em. Another good boar at Fair Oaks Ranch is Royal Rival 6th. He has a good back, heart girth and the rest of his good points include almost all the points there are.

That was sure some sale of Guernseys on May 16 at Arcady Farm, Lake Forest, Illinois, where 67 head sold for a total of \$102,925; a bull sold for \$10,000; a cow, for \$5300; a two day old heifer calf brought the Red Cross \$20,500. The bull "topper" was Don Diavolo of Linda Vista, six years old, bought by John C. Hartz of Boston. The cow was Langwater's Luxury, four and one-half years old, sold to Frank D. Stout of Angus, Wisconsin, but the thing that interests the "Traveler" is that our old friend "Bert" Nixon of Yountville, Napa County, was there and brought two of the best ones home. I saw them and I don't blame him, for they are beauties; two straight clean heifers, Cora of Gerar 3d, who set "Bert" back \$2500, and Pencoyd's Secret Rose that made another hole in the bank account to the tune of \$1075. They surely look as if they were worth it. Guernsey lovers should see them.

The "Traveler" attended the two day sale of Holsteins at Sacramento June 5 and 6 and will tell you all about it later.

ble early. Clip the wool from the infected part and wash well with a five per cent solution of sheep dip (two tablespoons to a pint of water) and apply pine tar, which is healing and also keeps off the flies.

Make certain that you have destroyed all the maggots and watch the sheep for a few days. Also keep flock properly "tagged" to prevent wet or foul places that will attract flies.

An important preventive is to burn or bury all dead carcasses, sheep tails, etc. as the blow fly will breed only in decayed flesh. Destroying the breeding places in this way will reduce the blow fly attacks.

Foxtail

With the grass becoming dry there is considerable trouble from foxtail spears getting into the sheep's eyes. Lambs are especially affected as they have considerable wool about the face and eyes to which foxtail spears adhere readily. As soon as a lamb or ewe appears wet below the eye, or

## Come to Stanislaus County for Registered Holsteins

STANISLAUS COUNTY LEADS

All counties of California in number of herds of registered Holsteins and number of 30 pound sires in service.

and dairy farm bulletins.

**General Laboratories**  
3141 So. Dickson St., Madison, Wis.

carrying the head a little to one side, it is well to catch her, and upon examination a foxtail spear will usually be found in the eye. This may be removed with the finger by rolling the eye backward a trifle. If the foxtail remains in the eye, the eye turns white, becomes greatly inflamed, and the eyesight is lost.

In treating for foxtail, it is important to get at the trouble early. When the eye becomes inflamed, it should be washed with a saturated solution of boracic acid or strong salt water. The eyesight is often lost, although occasionally the eye will become normal in four to six weeks.

Clip off the wool around the eyes of sheep to avoid further trouble.

### FARMERS ATTENTION

Farmers generally need to know and to understand that the federal employment service is establishing free employment bureaus or agencies all over this state to help the farmer secure the labor he needs to make and harvest his crops.

This service will not aid the farmer in any way unless the farmer will cooperate in the matter by going to and using the bureau. File your wants with the bureau agent and put it up to him to find you the help. He either will do so or will have to say that he cannot.

In event that he cannot get you the help then it is possible to get Mexican labor to aid in the harvest. The writer at the request of the farm labor committee of the state council of defense made a two weeks trip along the Mexican border and has made tentative arrangements for the bringing in of several thousand of these laborers if needed. But we must exhaust our own supply of laborers first. No one wants to have to resort to the importation of Mexican labor as long as we can avoid it, but food must be produced and labor must be had.

Once more, farmers call on your nearest free employment agent whenever you need labor of any kind. If you don't know him ask your postmaster. If he can't tell you then send a postal card to us.

This morning I walked down Second street in Sacramento and I think nearly 2000 idle men were there. The free employment office had applications for 1734 men and other employment agencies had orders for several hundred. More orders for men than there were men. Wages offered always from \$2.75 to \$5.25 per day, and yet the idle men will continue to be about the same. Who will be to blame if we have to bring in Mexican labor?

Some large employers of farm labor have indicated that in 1916 men worked an average of 11 days before laying off. In 1917 the average was seven days. This year it is five days. As the wages go up the number of days worked falls because it does not take so long to get \$15 or \$20 ahead and when they get that amount they retire until it is gone. Will laborers get wise to themselves and go to work and remain at work in time to prevent wholesale importations of foreign labor? We shall see. — J. P. Dargitz, Field Representative Public Employment Bureaus, State of California, representing the Farm Labor Committee, State Council of Defense.

### BACON QUARTERLY

The bacon hog now has an organ. Formerly this was the "Yorkshire Swine Monthly," but its field has been widened to include not only the Yorkshire but the Tamworth, both bacon type of hogs. The "Bacon Hog Quarterly" is published by R. W. Van Hoesen, Franklinville, New York.

## CONTROL SCOURS IN CALVES

The practice of allowing calves to remain with their dams until large enough for weaning has been proved unprofitable where there is a market for milk or butter fat. Consequently most farmers who sell the product of their cows have adopted hand feeding for raising calves. The economy of this practice goes unchallenged, but there is constant danger of causing digestive troubles in the calf.

The digestive organs of the young calf are adjusted to receive warm milk direct from the udder in small quantities at short intervals. Of course it is impractical to imitate such conditions when feeding by hand, but they should be duplicated as nearly as possible to avoid scours. Prevention, says M. H. Fohrman of the University of Missouri college of agriculture, is the best means of control. Over feeding, irregular feeding, dirty pails, cold milk, sour milk, or old milk will cause trouble. These, however, can be avoided.

Constant vigilance is the price of healthy calves, and the feeder must always be on the lookout for indications of scouring. At the first indication of disease he should effect a quick cure before the condition becomes chronic. Where calves are fed from the pail it is easy for the feeder to watch tails and hocks for indications of scouring. As soon as trouble is detected the feed of the calf should be reduced at least half. Administer a dose of castor oil in warm milk by means of a small drenching bottle. This will tend to remove all irritating substances from the bowels. Feed should then be gradually restored to the normal amount, and formaldehyde solution should be added to the milk at the rate of one teaspoon per pound of milk fed. This formaldehyde solution should be made up as follows: One part of formalin (40 per cent solution of formaldehyde) to 31 parts of water. If prompt improvement does not follow this treatment, repeat the dose of oil, and accompany it with another reduction in the quantity of feed.

The most critical periods in the life of the young calf are at the age of four to six weeks when the feed is changed from whole to skim milk, and six to ten weeks, when the calf is beginning to eat grain and hay.

Calves are always greedy, and for this reason over feeding should be avoided. This is true particularly when alfalfa hay is being fed, as it is exceedingly palatable, and the animal is apt to gorge itself beyond the capacity of its digestive ability.

## NEW YORK'S DAIRY SHOW A GREAT SUCCESS

New Yorkers turned out by thousands to see the National Milk and Dairy Farm Exposition at the Grand Central Palace. And the exposition that greeted their eyes more than measured up to expectations. The New York state department of agriculture was the largest exhibitor, and its exhibit showed the entire process of milk production, while the home economics department, by women demonstrators, conducted a dairy restaurant at which it was possible to secure a strictly dairy meal at the cost of about seven cents. This was made up from seven very satisfying courses from soup to dessert, at one penny each.

The most elaborate exhibit at the show was that of the New York Milk Distributors. This was made up almost entirely of the ponderous machinery that is required to handle the great supply of milk from New York City. There were giant clarifiers, pasteurizers, filling and capping machines, and a conveyor system which almost eliminates human labor. The most interesting and educational feature of the show was the exhibition of rats fed on various forms of seed food, which showed that dairy products are absolutely necessary for animal health and growth.

## Grasp This Opportunity

No matter how busy you may be, no matter how long a trip you must make to reach Lockeford, you will be amply repaid for the trip in the bargains you are bound to find in the

## N. H. Locke Co. Sale

**85 Registered  
Jersey Cows in Milk  
45 Registered  
Jersey Bulls and Heifers**

**Lockeford, California, Saturday, July 6, 1918**  
(Postponed from June 27)

Never before has such a superb lot of Jersey individuals been offered at public sale in the west, including all of the famous show ring winners in the Locke herd.

KING'S VALET IMP., veteran grand champion winner at many first class shows, will be sold together with 35 of his daughters, 28 of them now in milk.

BORELLO'S GOLDEN LADDIE, himself a prize winner, will be sold together with all of his daughters, most of them in milk.

FOURTEEN DAUGHTERS OF VALET'S KING OF L are in the sale, and they are all in milk and a most promising group of heifers.

GERTIE'S LAD has three daughters in the sale, all of them beauties and large producers.

The cow testing association records of each individual cow is shown in the catalog, and you will know just what sort of cow you are buying.

OVER 40 BULLS ARE IN THIS SALE, more than half of them from one to two years old, and the large number to be sold makes it a certainty that many of them will go at exceedingly low prices. At the prices at which these bulls seem bound to sell a dairyman can well afford to make a long trip to take advantage of a condition in this sale which is likely never again to be duplicated in a California Jersey sale.

Remember also that every animal sold is positively guaranteed to be a breeder, is tuberculin tested and sold subject to tuberculin retest by the buyer.

LOCKEFORD is in San Joaquin County, about 7½ miles east of Lodi, on paved highway. There are only limited hotel accommodations in the town, and parties from a distance would do well to secure accommodations at Lodi, where it will be easy to secure motor transportation to Lockeford the morning of the sale. PLEASE NOTE—That on account of the large number of animals to be sold in one day it will be necessary to start the sale

Catalog now ready. Write for one.

MANAGEMENT

**California Breeders Sales and Pedigree Company**

C. L. Hughes, Sales Manager, Sacramento, California.

Auctioneer—Col. D. L. Perry, Columbus, Ohio.

**Thursday, July 25, 1918**

*will be the date of sale when we will sell*

**125 Registered  
Holstein Cows, Heifers and Bulls**

—FOR—

**A. W. Morris & Sons Corporation  
Woodland, Cal.**

This sale was originally announced for July 11, but has been postponed to the date mentioned above.

This is going to be the real bargain sale of the year, from every present indication, and buyers make the very most of this unusual sale to secure for themselves some of the famous high record animals that seem bound to sell at very moderate prices.

There will be 100 cows in this sale, at least 60 of them bred to King Mead of Riverside and Prince Gelsche Walker, including THREE 30 POUND COWS, three sisters to

TILLY ALCARTRA, four daughters of IGNARO DE KOL, three cows with records above 1000 pounds butter in one year, several DAUGHTERS OF PRINCE GELSCHER WALKER,

several daughters of SEGIS PONTIAC DE KOL BURKE, four daughters of DE KOL BURKE, one of them a 32 pound four year old, TWO 29 POUND COWS, 38 cows with YEARLY RECORDS UP TO OVER 1000 POUNDS BUTTER, and a large list of high record, splendidly bred females.

There will be in this sale about 18 high record cows with blemished udders, most of them unmistakably with calf, and they will present an unusual opportunity to secure sons and daughters of the famous Morris herd sires at very moderate prices.

All, or nearly all, of the 100 cows are bred or else will be fresh just prior to

sale date, and a very large number of them are far along with calf. There will be some great buys among them.

PLEASE NOTE—Watch next week's issue for place of sale and more detailed announcement of the individuals to be offered.

Catalog now in preparation. Write for one.

# Cutter's Refined Germ-Free Anti-Hog Cholera Serum

*Produced in the Most  
Up-to-date and Best  
Equipped Anti-Hog  
Cholera Serum Plant  
in the World.*

Does away with the risks that necessarily attend the use of a serum that is not germ-free.

It is 20% more efficient, measure for measure, than the old type, "bloody" serum, is much more quickly absorbed, does not discolor the flesh at point of injection, and carries no liability of producing abscesses.

80 c.c. of Cutter's Refined Germ Free Serum is just as efficient as 100 c.c. of the best old type "bloody" serum.

But we make the old type serum, and do the job so well that though we have sold several million c.c. since we started production in 1917, there has been not even one complaint of failure to protect, or of bad effects following its use.

So, whether you use the old or the new kind, insist on "Cutter's," for in either case you will be getting the best that can possibly be produced.

Remember, a serum may be "clarified," or "clear," and still not be germ free. Such a serum is almost as dangerous as a "bloody" serum. Cutter's Refined Serum is not only clear but it is Germ Free.

Write for our two new booklets, "Hog Cholera Prevention," and "Special and Detailed Information Concerning Hog Cholera Immunization." From the latter you will learn what constitutes good work and why a competent veterinarian should be employed.

## Prices.

Cutter's Refined, Germ-Free, Anti-Hog Cholera Serum is 2½ cents per c.c.

Cutter's Regular, or "old type" Serum, is 1½ cents per c.c.

Cutter's Hog Cholera Virus, for use with either type of serum, is supplied at 1½ cents per c.c. It is dependable.

We prepay shipping charges.

Let your veterinarian order for you and encourage him to be liberal in estimating the amount of serum to use; safety lies in giving more than may be needed rather than trying to figure too fine.

Should he be prejudiced in favor of some other serum, there is a reason that concerns him but not you, except insofar as it should make you more insistent that Cutter's Serum be used. In such case do your own ordering direct from us. You will get "Cutter's" promptly, prepaid.

## Weights for Barn Use

A quart of the following feeds weighs the pounds or fraction of a pound opposite each:

Cottonseed meal, 1.5 pounds; linseed meal, old process, 1.1 pounds; wheat bran, coarse, .5 pound; wheat shorts, coarse, .8 pound, and fine, 1.1 pounds; corn meal, 1.5 pounds; oats, 1.2 pounds; crushed oats, .8 pound; barley meal, 1 pound.

## DON'T WASTE FEED

At least 37 per cent of the digestible material of the corn plant is left in the stover when the ears only are used. When corn is ensiled this 37 per cent goes into the silo with the 63 per cent in the ear. The importance of this saving will be more apparent when given a money value. With a yield of 50 bushels an acre, the value of grain is \$65, at \$1.50 a bushel. Since the stover contains more than one-third of the food nutrients it is worth at least one-half as much as the grain, or \$32.50. How many farmers will willingly leave in the field \$32.50 an acre? Yet this is done in many sections of the country where the corn is husked and the stover left in the field.

But suppose the dry stover is fed as roughage. Even then it is not saved as completely as in silage. When, under ordinary farm conditions, corn is cured in the shock the loss of dry matter is approximately 25 per cent and may be as high as 45 per cent. These losses are due to the breaking off of leaves by the wind

and in handling, and to destructive fermentations. The loss of dry matter in the silo is very slight when the silo is tight and the silage well packed at the time of filling. As silage the cornstalk is all consumed, but as stover only the leaves are eaten unless it is shredded, and even then a great part of the stalk is discarded. Some feeding experiments show that even in shredded stover the portion discarded is as high as 31 per cent. This is in addition to the loss of dry matter during the curing process.

Too frequently an unfavorable season like that of last year results in the loss of the whole corn plant or in immature soft corn that is of little value. By far the best method to utilize corn which is immature at harvesting time is to put it into the silo. Even frost-

ed corn will make satisfactory silage if harvested at once. If it becomes dry; it may be saved by adding water during the filling process.

The making of as much silage as can be used will do much to conserve the feed supply. Have you planned to fill that silo?

## WHAT THE COW TESTING ASSOCIATION CAN NOT DO

It can not compel a dairyman to dispose of his poor cows if he is determined to keep them. It can not make him feed according to production nor practice economy in the management of his dairy herd. It can not require him to dispose of his scrub bull and buy a better one. It has never yet demanded the planting of legumes and the building of silos. It never will compel, but it always will encourage, economical improvement of the herd, of the farm, and of the business.

## PUMPS

**Are Helping To Win This War  
By Raising Water To Raise Food Stuff's**

What are you doing with your land? Big yields are necessary now and it is easy to sell what you raise at a high price. We know from experience what pumps and power are necessary to deliver the amount of water required at the lowest cost.

DEALERS:—Write for Unoccupied Territory.

**SMITH-BOOTH-USHER CO., Los Angeles**  
The Pump and Engine House of the Pacific Coast

Gould's Centrifugal Pumps and Crocker-Wheeler Motors reduce the cost of pumping. See our engineers and get first hand information.

## Boiling Points

—are vaporizing points. In Red Crown gasoline they form a continuous, uniform chain—giving steady, dependable power. Look for the Red Crown sign.

**STANDARD OIL COMPANY**  
(California)

## The Gasoline of Quality

Clean and Clear  
as Water

Gold Medal  
Pan-Pac. Expo.

## For Retained Afterbirth

When a cow fails to "clean" promptly, she should be flushed out with B-K. A retained afterbirth neglected may cause Abortion or Barrenness.

B-K as a douche brings the afterbirth naturally—saves removing by hand. B-K kills the infecting germs and foul odors—heals the uterus—removes slime and acid—no straining—no irritation. B-K is much more effective and safer than lysol, carbolic acid, Lugol's solution and oily coal-tar disinfectants, which do not cleanse the uterus, but make it more acid.

If your dealer does not have B-K, send us his name.

FREE BULLETINS: Send for complete information—"special trial offer" and bulletins No. 52, "Contagious Abortion," and No. 136, "Calf Scours."

## Experience in Insect Control

Horticultural Commissioner Bremner of Sonoma County writes:

"A mild winter and spring may possibly be responsible for the abundance of many of our common and some very uncommon insect pests in orchards and garden. In treating this condition we have found an old formula very effective in destroying all leaf eating forms.

"Dust the affected parts thoroughly, using either a coarse sack, blower or perforated can, with the following mixture: ten pounds hydrated lime (A grade), one pound Paris green. Sift the hydrated lime and mix thoroughly with the Paris green before placing in the dusting apparatus.

"For cutworms or beetles cutting off tomatoes or other similar plants near the ground, a perforated can is best as the stems must be covered at the surface of the ground. The cost of the materials for tomatoes is approximately \$1.00 per acre.

"Also wish to call attention in grape growing sections to the greater efficiency gained in controlling powdery mildew by the use of the more finely ground sulphurs now on the market. We wish particularly to recommend a product now being sold under the trade name of 'ventilated sulphur.' We also find this makes a very fine paste for use on red spider. In mixing sulphur paste we have found that more glue is necessary than at first supposed. We use at least one ounce to each five pounds of sulphur; the formula being as follows:

"Dissolve one ounce of dry glue in boiling water and dilute to one gallon. Stir this slowly into five pounds of sulphur. This is sufficient for 100 gallons of spray.

"This preparation is improved by standing and should be made up at least twenty-four hours before using."

## Financing Farmers

A number of San Francisco business men, working with bankers of Stanislaus County, have taken up the plan proposed by the California Development Board for financing food production. In a word, the plan is:

A group of men subscribe to a list by which they loan their credit to the banks, guaranteeing certain loans. Suppose Stanislaus County needs or could place \$100,000 or extend that amount of credit to practical farmers to increase the production of food-stuffs, but who had no security to offer the banks, 100 or 200 men can loan their credit to the banks in sums of \$500 or \$1000 each and through a board of trustees selected by the subscribers pass upon and endorse each loan made under the form of guarantee.

The plan decided upon, the next problem was where to get the money if the banks should need it. The development board was instructed to confer with the officials of the federal reserve bank, a branch of the United States treasury, to that end. This instruction was followed, and the resulting conferences with federal reserve officials proved that they were willing to do anything in reason to assist. Gavin McNab and Luther Elkins, attorneys for the federal reserve bank, and Geo. T. Wright, counsel for the chamber of commerce, drafted an underwriters agreement, form of note and endorsement that were entirely satisfactory to the bank, and the plan was successfully launched. There is little or no chance for loss; it is the intention to cooperate where possible with county councils of defense and their many patrols who will report all untitled acreage, advise where possible and report where aid is needed.

The business man and farmer are the same under the skin and this is simply a revival of the plan of our forbears helping a neighbor with teams and men in emergencies, only in this instance the business man loans his credit instead of teams. There is another much-to-be-desired result which this plan will aid in bringing about; the interests of the farmer and business man are absolutely interdependent, for everybody knows that when the farmer is broke we are all broke. These are critical times, and by settling himself in the collar alongside the farmer and pulling with him the business man proves that he is the farmers' friend, and to-

gether they will prevent others from rocking the old Ship of State. The majority of men yet believe that at least 95 per cent of their fellows will pay their debts if they have the money and will back their belief with their credit. The chief difficulty of the farmer has been his lack of organization and not knowing to whom to make the high sign for help when in trouble. It is hoped this plan will, to a great extent, remedy that.

As a business proposition the plan is an excellent one to develop the re-

sources of the county and state, but in the present emergency "business" is a side issue. When our forbears, with one hand on the Book and the other raised before their God, pledged their lives, their fortunes and their sacred honor in support of a document which their children's children are fighting to maintain, they took no thought of business.

### SHORT COURSES

The University Farm at Davis is issuing formal announcement of the short courses which will be given at University Farm, September 30 to November 8, 1918.

The purpose of the short courses in agriculture is to enable persons, especially those of mature years and ranch experience, to acquire a knowledge of the fundamental principles of agriculture and of the results of the latest investigations in the production of fruit, field and forage crops and live stock of the various classes.

There will be courses in general agriculture (including animal husbandry), horticulture, poultry husbandry and dairy manufactures. These courses will be followed by two-week courses in: Market milk production, November 11-22; butter making, November 11-21; cheese making, December 2-13; milking machines, December 2-13; beekeeping, December 2-7; gas tractors, November 11-19; gas tractors (experienced men only), November 20-22.

Thousands die every year from over eating—don't dig your grave with your teeth.

The U-boats are wasting our food; don't be a U-boat.

## Side Hills

The steel balls in the Yuba Ball Tread Tractor run in a steel ball race forming a tube. The thrust of the weight of the machine is borne just the same sideways as from the top. The round balls roll on an angle as easily as along the level. The Yuba is the tractor for side hill as well as level land.

Investigate this feature from Ball Tread owners.

## Two Men Can Thresh Beans With This Don't Risk the Loss of a Valuable Bean Crop by Rain When You Can Get a Satisfactory Small Machine

VENTURA JUNIOR BEAN THRESHER, No. 2.

To meet the demands of hundreds of bean growers who have a comparatively small acreage, too small, perhaps, to obtain the services of threshing outfits employing 40 or more men, we offer the Ventura Junior No. 2 Bean Thresher, a thoroughly practical and satisfactory small machine that can be operated by only two men. It is made on the same principles as our larger machines that have given satisfaction in California for the past 22 years and will thresh every variety of beans. Can be operated by tractor or gas engine and easily loaded and moved from place to place.

It is sold mounted or unmounted and with or without gas engine. This thresher is equipped with cylinder teeth as found by experience to be far superior to machines made elsewhere equipped with round iron pegs for teeth. The cylinder teeth in the Junior O can also be equipped with clips,—special Ventura devices for quick accurate adjustments.

We make six sizes of bean threshers. Write us regarding bean threshing machinery, stating what acreage and power you have and in what capacity machine you would be interested.

Our manufacturing facilities here are such that we offer our customers superior service as compared to service from the east necessitating long freight hauls on heavily loaded roads. If you want a bean thresher it would be prudent to order early and order where you know delivery can be made and where parts can be obtained on short notice.

**The Ventura Manufacturing and Implement Co.,**  
Ventura, Calif.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertion 3c per word;  
yearly contracts 2½c per word; 35c per issue minimum charge.

### TREES

**For Sale to Nurseriesmen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by July 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

**For Sale**—Extra fine Valencia trees, ¾ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, California. Phone, Anaheim Pacific 403-J.

**High Prices For Figs**—Insure a large crop of Smyrna figs this year by using plenty of Capris. Make reservation now for June-July delivery of guaranteed Capri Figs. Price \$6.00 per thousand. Write stating quantity desired. L. C. Collins, Ceres, California.

**For Sale: Citrus Trees**—Choice stock, young and thrifty. Selected buds, Valencia and Washington Navel, Eureka and Rialto seedless lemon. Marsh seedling grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., F 3110, Los Angeles.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Valencia Oranges and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**For Sale**—5000 one year old seed bed stock. 150 Italian Cypress 5 to 7 feet balled. 100 Feijoa 3 to 5 feet balled. Enterpriser Nursery, R. D. 2, Box 305, Pasadena.

### SPECIAL

**SHARPLESS AVOCADO TREES** Mather's Avocado Nursery, 137 N. Fair Oaks Ave., Pasadena, California.

**Citrus Trees**—All kinds, any quantity. Butler's Morning Side Nursery, La-Manda Park, California.

**Citrus Nurseries**, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

### SEEDS AND PLANTS

**Bean Seed For Sale**—We have good seed beans on hand of following varieties: Limas, blackeyes, large white, small white, pinks, Teparys, Henderson bush, Mammoth bush. Now selling bean bags for fall delivery. C. C. Collins Company, Santa Ana, California. Sunset 71; Home 172.

**Early Amber Sorghum** makes the best silage and produces the greatest tonnage per acre. Recleaned seed 9c per pound f. o. b. Stockton. Fancy recleaned Sudan seed at 18c per pound f. o. b. Stockton, in lots to suit. Aurora Seed Mill, 48 N. Aurora St., Stockton, California.

**Sudan Seed 17½c**, Amber Cane 7½c, Feterita, Egyptian Wheat, Red and White Milo Maize, Hickory King Corn extra good. Dwarf White Milo Maize yields 21 sacks per acre. S. Peruvian Alfalfa. Box 501, Fowler, California.

**Belladonna Seed** for sale in from 1 pound to 50 pound lots. Selected seed from strong thrifty plants. Prices reasonable. Address Bellatopia Ranches, P. O. Box 1470, Los Angeles.

**Sudan Seed** makes good quick feed, 17½c per pound. Wm. Ritchie, Riverside, Arlington, California.

**Yellow Sweet potato plants** \$1.00 per thousand. W. L. Lutz, R 3, Santa Ana.

### ENGINES

**Several New and Slightly Used Engines**, ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

**For Sale**—One 15-30 Gas Pull Rumley engine, cost \$2000.00, will take \$1500.00. Abram Marron, Jr., Box 10, Oceanside.

### PATENT ATTORNEYS

**Patents that protect** are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "Patents."

**Patents**—Copyrights, trade marks and labels registered. Solicitor of American and foreign. James R. Townsend, 712 San Fernando Bldg., Los Angeles. Phone: Home A4619; Sunset Main 347.

### LUMBER

**Lumber-Sash-Doors-Plumbing**—Supplies—Building materials of all kinds. New and second hand. A. R. W. shingles 60c per bundle. Send list for estimate. Dan P. (Mission Street) Dolan, 1620-1650 Mission Street, San Francisco.

### GOVERNMENT LAND

**Be Patriotic**—Raise stock. Oregon, California openings. Valuable land marked plainly on County sectional map. \$2.50 any county. Booklet Free. Joseph Clark, Sacramento, California.

### MACHINERY

#### FOR SALE—WHY BUY NEW?

**SAVE YOU HALF MATERIAL GUARANTEED**  
**IRRIGATING PIPE**—1000 ft. 4-in. at 16½c; 400 ft. 10-in., 44c; 4-in. riveted 16c. **WINDMILLS**—8 ft. \$29; 10 ft. \$39; 12 ft. \$55 to \$65; 16 ft. \$95 to \$125, cost \$280 new; costs nothing to run.

**DEEP WELL PUMP, BULLDOZER**, 20-in. stroke, with 7-in. cylinder, 100 ft. 8-in. casing, rods, all for \$225.  
**HOW'S THIS?** 25,000 gal. redwood tank, \$125; 1500 gal., \$22; galv. drums, \$4; 30 gal. hot water boilers, \$350; 8000 gal. heavy corrugated galv. tank, \$150; 900 gal. heavy riveted steel wagon tank, \$68; wagon tanks, \$28 to \$48; new, used redwood, galv. tanks, all sizes.

**ODDS, ENDS—CHEESE CUTTER**, \$5; automatic chicken feeders, \$2.50 capacity 50 chickens; large rendering kettle, \$10; alfalfa cutters, bone grinders, blower, cable; heavy log chain and drag hooks, \$10; big hay fork, \$6.75; low down tank pump, \$7.50; wheelbarrows.

**DEEP WELL PUMP, DOUBLE-ACTING AMES**, pumps more with less power, \$145, or complete with 7-cylinder 100-ft. 8-in. pipe and rods, \$375. Large Myers Bulldozer pump, \$78; small size, \$42.50. No. 4 vert. B. & J. two-step centrifugal pump, \$150. Many others.

**USED PLOWS, MOWERS, RAKES**, cultivators, single disc riding plow, \$47.50; 14-in. Gilpin Deere riding plow, \$32.50; 4-gang Stockton, fine shape, \$27.50; spike harrows, mowers, rakes, bean cultivators, \$45; spring tooth harrows.

**SUNDRIES, CHEAPEST IN TOWN**: material guaranteed. Office DEMMITT CO., 120 N. Main, upstairs. Yards 816 Yale. Phone 15191, Edwy. 1984, Los Angeles.

#### REMANUFACTURED PIPE

All sizes, standard pipe, and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

#### WEISSBAUM PIPE WORKS.

169 Eleventh St., San Francisco.

**Automobile Motors for Sale**—These used motors in fine condition; for stationary work, pumping or for tractor. Bargain prices. Big supply. Send for catalog. Economy Auto Parts Co., 490 Golden Gate Ave., San Francisco.

**For Sale**—1 Russell thresher, 30x50 fully equipped. 1 Rumely GasPull Tractor 15-30; both in first class condition and have had little use. Will sell cheap. L. A. Skiles, Neenach, L. A. County, California.

**Gasoline Engines**, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

**For Sale**—Holt 1911 Sidehill combined harvester 16 ft. header 24 inch cylinder, \$500; cash or terms. B. Buckley, Berkeley.

**For Sale**—Stationary thresher complete outfit including engine. Ready for field. A real bargain will sell cheap. Route C, Box 82, Hanford, California.

**Sandusky Tractor** with three gang plow. Perfect condition, nearly new. Price \$1500 cash which is half value. Owner 319 Central Building, Los Angeles.

### WANTED

**Wanted**—Motormen and conductors by Pacific Electric Railway. Age 18 to 35. Apply in person to Superintendent's office, 218 Pacific Electric Building, Los Angeles.

**Position Wanted** as foreman on orange ranch. 30 years experience, understands soils and trees, formerly seven years with San Dimas Nurseries, W. T. Preston, Glendora, Cal.

### LIVE STOCK

**D. E. Kellher**—Importer and Breeder of Hampshire sheep, Eugene, California, offers for sale a choice lot of yearling Hampshire rams sired by Walnut Hall and Butterfield Rams, purchased at Salt Lake, August, 1916, also a few yearling ewes of same breeding. Inspection and correspondence invited.

**Sheep for Sale**—About 1000 head of Black Face and Merino Ewes. A good buy. Address John G. Mee, St. Helena, California.

**For Sale**—300 Angora goats not over three years old. Frank Motte, Box 107, Arlington, California.

**Shetland Ponies**—Dispersal sale. Write for list. N. C. Sorensen, Onalaska, Washington.

### RABBITS

**Go into Business for Yourself**—Raise rabbits for meat and fur. Raise stock for us. We buy all you raise. Orders booked now for March delivery. Our booklet mailed for 10 cents. Los Angeles Fur Farm, Dept. C. C., 2669 N. Griffin Ave., Los Angeles.

**A Fortune in Rabbits**—Have raised the price we will pay to \$8.00 per pair. Want you to raise them for us. Send stamp for particulars. H. E. Gibson Co., Arcadia, California.

**For Sale**—Rabbits, New Zealand and Flemish Giant, young stock. Paul Krueger, Watsonville, California.

**Rabbits, Remedies and Supplies**. Send for price list. Caldwell Rabbit Farm, Los Angeles.

### CATTLE

**SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs and Shetland Ponies**. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Gullford, Owners.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, California.

**For Sale**—On account of dissolution of partnership will sell thirteen registered Guernsey cows. Choice individuals just in their prime. P. J. Weisel, Santa Fe Springs, California.

**Registered Holstein Bulls** from high producing dams for sale at reasonable prices. Also a few choice females. McAllister Sons, Chino, Cal.

**Registered Holstein Bull**—Straight, strong constitution, well marked, good pedigree. Write to Sunnybrook Ranch, Willits, California.

**Registered Shorthorns**, cows with calves at foot, yearling heifers and bulls for sale. Prices on application. Fair Oaks Ranch, Willits, Cal.

**Venadera Jerseys**, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Registered Holstein Bulls** of various ages for sale. Milbrae Dairy, Milbrae, Cal.

**REGISTERED JERSEYS FOR SALE**. J. R. CARHART, FULLERTON, CAL.

### FARM LANDS FOR SALE

#### Attention Land Buyers!

Here's an excellent proposition: 40 acre farms selling for \$15 to \$25 per acre, long time payments, 6 per cent interest, in the best agricultural part of Snohomish County, where you have all the modern conveniences, paved roads, railways, schools, churches, mills and factories. This district has proven its worth by the many successful farmers now located there. We also have some beautiful water front 10 acre tracts. OPPORTUNITY knocks at every man's door ONCE, but believe me, it does not continue to knock forever nor does it pound the door down. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

**For Sale or Exchange**—60 acres rich, alluvial silt soil. Level. Irrigated, ready for crop. Real alfalfa land. Domestic water on place. Plenty of irrigation water. 1¼ miles from town, churches, grammar and accredited high school. Half cash, half trade, anywhere. Make your proposition now. Chas. McNeely, Alpaugh, California.

**Retail Dairy** with modern equipment. 30 select cows, fine 20 acre ranch, beautiful 11 room house, barns, silos, pumping plant and many other things to go with the ranch. ½ mile from high and grammar school. Los Angeles suburb. Address V. Care Cultivator.

**For Sale**—Big snap, acre, piped, fenced, plowed, 5 room plastered house, bath, gas, 535 W. 92nd. Worth \$3500; only \$2250; \$1000 mortgage. \$250 cash, balance rent. O'Donnell, 937 E. First St., Long Beach.

**For Sale**—Fine Paying Lemon and Orange grove. Upland district, none better; 10 acres, ample water stock; good improvements. C. W. Knapp, El Centro, California.

### POULTRY

**Our Annual Cockerel**, pullet and hen sale. 45 Eureka, Pasadena. 200-250 egg strain, 25 per cent 50 per cent off. 50c up. Leghorn, Wyandottes, Reds, Rocks, Anconas, Minorcas, Orpingtons, ducks, turkeys. Our early maturing winter layers develop rapidly into money makers. Hens clearing \$5.00 yearly. Chicks, thrice weekly 15c, 17c, 20c worth double. James Beeson, Pasadena.

**\$13.00 per 100 Barred Rox**, Reds, B. Minorcas, White Leghorns \$9.00. Terms \$2.00 with order, balance C. O. D. Ship Monday and Wednesday. A. G. Rowe, Inglewood, California.

**Black Orpingtons Lay**, Weigh and Pay—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, California.

**Wanted 500 or more White Leghorn pullets**, February or March hatch preferred. Samuel Eyer, Tulare, California.

**Buff Orpingtons, Buff Ducks, Bourbon Red turkeys**. The Ferris Ranch, S. Reservoir, Pomona, California.

**Eastman's Bred-to-Lay Barred Plymouth Rocks**. Hatching eggs. Fairmead Poultry Farm, Fairmead, California.

### AGRICULTURAL IMPLEMENTS

**IMPLEMENTS AND RANCH SUPPLIES**. Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches.

ARNOTT & COMPANY, INC., The Yellow Front. Established 1892. 112-118 S. Los Angeles St., Los Angeles

### PIGEONS

**Pigeons**—White Kings, Giant Runts, mated and young stock. F. Sanderson, 1170 Bird Ave., San Jose, Cal.

### HOGS

#### BERKSHIRES GUERNSEYS GRAPE WILD FARMS

A few fall boars left by Royal Superbus—also a limited number of fall gilts. We have early spring pigs of both sexes and we are breeding some top gilts for fall farrow. Prices upon application. A. B. HUMPHREY, Escalon, San Joaquin County, California.

**Poland-China Hogs**—On account of the draft must sell 4 tried brood sows bred to an extra good son of I. B. A. Wonder. 3 at \$75 each and one \$150. Also two yearling sows big, smooth, long and bred \$65 each. Also 4 September Big Bob gilts out of an imported sow will breed to Meddling Wonder \$55 each. One February boar \$50, two at \$35 and two at \$25. 4 February gilts at \$30 each. All recorded, crated and transferred f. o. b. Allen M. Lester, Care N. M. Lester, Gridley, California.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**"Billiken" Chester Whites**—The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar that is just 13 months old. C. B. Cunningham, Mills, California.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Rancho Rubio Durocs**—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

**Mule Foot Hogs**, large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums."

**Duroc-Jerseys**—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Callistoga, Cal.

**Large Type Poland Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, California.

**Duroc-Jerseys**—We breed the champions. Peters, Lamson & Walker, Devore, San Bernardino County, California.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, California.

**HEWITT'S BIG TYPE POLAND-CHINA** gilts and boar pigs. Hewitt & Hewitt, Dixon, California.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Berkshires**—A few very fine March farrow pigs, sired by Fair Oaks Champion. Fair Oaks Ranch, Willits, California.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. F. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### BIG TYPE POLANDS

W. H. BROWNING, WOODLAND, CAL.

### MISCELLANEOUS

This model now selling for \$1155. Sacrifice for \$550 to quick buyer. Terms. Call or write 55 E. Laurel Ave., Sierra Madre, California.

**For Sale: Fruit Cars**—100 used fruit cars in good condition, size 3-ft by 5-ft. outside measurement, to fit track 25¼ inches; also 1500 feet ¼ by 1 track iron. Price cars \$4.50, iron 6c per lineal foot, f. o. b. Santa Ana. C. C. Collins Co., Santa Ana.

**For Sale** to citrus fruit growers: 10,000 gallon smudge oil; 1000 Dunn 7-gallon heaters; one 500-gallon tank wagon; two 6000-gallon storage tanks; 10 Canco torches; 10 5-gallon filling cans. L. G. Baldwin, Upland, California.

**To Reduce the high cost of living**, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

### FERTILIZERS

**Slacked lime** corrects sour, heavy soils, prevents gum disease and by correcting your soil wrongs, you get better results from your fertilizers. Alfalfa, beans and peas are lime plants and need lime. Slacked lime acts quickly. Price low for immediate shipment. Gypsum supplied. H. B. Matthews, 495 Douglas St., Pasadena.

### GOATS

**Toggenburg Milch Goats**—Rae P. Williams, Federal Realty Building, Oakland, California.

## SPINACH IN CALIFORNIA

Continued from Page 745

and usually run from two to ten tons per acre, except in cases of total failures or remarkable success.

The variety used is of utmost importance. It has been estimated that the loss from the use of a variety introduced in California in 1917 from Japan was 60 per cent. In some in-

stances it was not harvested at all. Bloomsdale Savory has also proved to be much less desirable for canning than other varieties, although it has been extensively used from necessity. Prickly Winter has been the favorite variety, but Long Standing has been used for late plantings and is well liked. De Gaudry and Italian spinach are two other varieties which are being used for the first time this year.

Ferguson Co.

Los Angeles, San Francisco, Fresno

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Note in Oregon

How long before a note is outlawed in Oregon? Will a letter showing that the maker of the note asks for extension of time and promising to pay extend the life of the note? — Subscriber, Hemet.

In Oregon actions upon contract must begin within six years from the date of maturity of the contract. The letter, as stated in the question, would be sufficient to renew the obligation.

### Collecting Rent

A tenant moved out of my house and failed to pay several months rent. He is married and works for wages. How much of his wages, if any, can I obtain through legal action? — Subscriber, Gardena.

House rent is considered a necessary of life. One-half the earnings of the debtor for his personal services rendered at any time within 30 days next preceding the levy of execution or attachment are subject to the writ and for earnings prior to said 30 days the whole thereof are subject to the writ.

### Road Right of Way

There is an old road running across my land which has never been laid out or surveyed and there are settlers who travel across the road. Is it lawful for me to have barbed wire gates placed on the road across my land? — Subscriber, Aguanga.

The settlers may have acquired some right of way over this road. In the absence of such an established right you would be entitled to close the road. With the present information, however, it is recommended that you take the matter up with the board of supervisors of your county. Under subdivision nine of section 2643 of the political code they are vested with power to provide for the establishment of gates on highways and prescribe rules for opening and closing the same with penalties for violating such rules, provided that the expense of erection and maintenance of such gates be borne by the parties for whose immediate benefit they are ordered.

### Tree Nuisance

Some of my neighbors permit a tree known as a "cigarette tree" to grow on their land. This tree has very fine seed which the wind scatters over my land with the result that considerable labor is caused me to keep my land in condition. Is there any way in which I can compel my neighbors to keep them cut on their land? — Subscriber, Aguanga.

The owner of land has no right to so use his land as to render that about him in any degree useless and has no right to inflict upon his neighbor any injury which can reasonably be avoided. If, therefore, he makes a use of his property which is unreasonable, unusual, and unnatural, although in itself lawful, he will be held liable for the injury caused thereby to adjoining property, provided the injury is real and not fancied. It might be possible for you therefore, to enjoin your neighbors from permitting this seed to fall upon your land, from which it would result they would have to cut down the trees complained of. You might hold them in damages for the extra labor caused you.

## THRIFT STAMPS A LA WALT MASON

"In times of war they ask us for the necessary cash to land upon the war-like Hun and deal the fatal smash.

"And it is right. To win the fight we've got to have the dough, and those who stay will have to pay for those who have to go.

"Buy SAVINGS STAMPS and put the clamps upon the German horde.

We'll surely win if you kick in—buy all you can afford.

"The boys who fight have every right to look to us to pay. They bear the brunt, so do your stunt, Buy Savings Stamps Today."—L. C. Davis.

We should honor the hero of everyday life, the commonplace man who fights his battle for bread and sustains a home on his broad shoulders.

## You Pay Too Much when You Pay Too Little

To buy anything today at the price you paid for it even a half year ago is practically impossible. It can't be done—you know it.

The best way to economize in overall buying is to buy overalls that wear well and last longer. Buy the ones you have always depended on for comfort, service and value!

In other words, it is *always* good economy to buy Boss of the Road Overalls—a Neustadter product. Look for the Bull Dog on the label. It is your protection. Never has this trade mark meant so much to you as it does today.

Buy them from your local dealer

## Belladonna Raising Profitable

When it is taken into consideration that, when planted in rows three and one-half feet apart and spaced the same distance in the rows there are 3555 plants to an acre of Atropa Belladonna and that the leaves of this plant have not marketed for less than \$1.20 per pound (going as high as \$2.25 per pound) in the past three years it is not hard to conceive how a single acre planted at Pasadena yielded \$2400 in a single year on four cuttings of the leaves. Any intelligent boy or girl can operate a small planting of Belladonna in their spare hours and proper attention in the way of thorough cultivation after the plants are established cannot fail to bring good results. The Haas Seed Company, 1800 Lincoln Avenue, Pasadena, California, have a limited amount of high grade selected seed for sale. Any persons interested in securing guaranteed seed should write them for particulars.—Adv.

**Air is Cheap**  
Use Plenty of It

Air pressure not only affects the duration of your tires, it also has a very direct bearing on how many miles per gallon your gasoline will give you. Measure your air pressure with a

**Schrader UNIVERSAL**  
Tire Pressure Gauge

and save not only your tires but your gas. When your tires are under-inflated it takes more gasoline to drag them along the road—sometimes as much as 25% more.

## WITH THE SAME PRIDE

One star for all she had,  
And in her heart  
One wound—yet she's glad  
For all its smart

As they are glad to bear  
The pangs of birth  
That a new soul and fair  
May come to earth,

Seeing, she too, was one  
Who from Death's strife  
Granted her first-born son  
Proudly to Life.

Now with that very faith,  
Life justified,  
She grants a son to Death  
With the same pride.

—Theodosia Garrison, in Everybody's Magazine.

## THUMBS UP

**I**T WAS Dr. Harmon who first called him Thumbs Up. Everyone was amazed to learn that it was the great surgeon who had coined the name. He was so austere and strictly "professional" in his manner that no one dreamed he was human enough to invent a nickname for a small patient. In secret the nurses had long referred to Dr. Harmon as the Great Bear, and until Thumbs Up came to the ward no one at the hospital ever saw any but the Great Bear side of the surgeon.

If people had given the matter thought, they would have known that beneath the impressive dignity there was deep sympathy for suffering childhood. His friend, Dr. Phillips, could tell of a day when he and the surgeon stood before a certain Sorolla canvas. A padre has gathered along the beach for a morning bath his young charges from a children's hospital. It is a painting of the infinite tragedy of handicapped childhood. Sorolla has said he will never paint another picture of the kind. Suddenly, as the two men stood gazing, one spoke.

"Man alive, Phillips, I've got to get home. This holiday business will have to wait until there aren't any suffering children." And the first steamer brought Dr. Harmon back to his profession.

Two mornings a week the clinic at St. Luke's was conducted by this great surgeon, who gave his time and mastery of surgery to the alleviation of pain.

Thumbs Up was just one of hundreds of cases. The morning he lay upon the operating table there were six other children awaiting their turn, and apparently there was nothing to distinguish him from any of the others. But individuality asserted itself as little Jack lay waiting.

The young anaesthetist smiled down at him and said, "Now, old man, I'm going to put you to sleep. What do you say to that?"

Instantly two little hands changed position. "I guess I says thumbs up. I allus do when I'm skeered to death."

Dr. Harmon turned from giving some directions to a nurse and looked at little Jack. He lay with his eyes tightly closed, every muscle in his little body taut and his hands at his sides, with both thumbs up.

"Hurry up, please. I've said it seven times a'ready. Most allus it helps a lot."

Suddenly two strong, large hands covered Jack's. Dr. Harmon grasped the little fingers in his own. "Now," he said, "while you go to sleep, I'll keep saying thumbs up for you, and when you wake up everything will be all right."

No one ever called Dr. Harmon the Great Bear again.

Some time afterwards a little figure was laid upon a little white bed. When Jack entered the room, it was known as Ward C. Months later, when he left it, there closed behind him a door bearing a brass tablet upon which were the words:

Thumbs Up Ward  
Named in Honor of a Brave Little Patient, John Henry Grayson.

But we are anticipating the story.

The days were tediously long for John Henry after his operation. A very heavy something swung from one ankle and his back ached "from using it so much," as he said to his nurse. Everyone who took care of him wore

a blue dress and a white apron, and all the young doctors looked alike in their white suits, and so there was a pitiful absence of variety in what he saw. All the other little boys were ill, too, and they all occupied the same kind of bed. Life was deadly dull. But the young physician who had "put him to sleep" visited him every day, and his coming always cheered the boy. Jack loved the doctor, and the doctor loved Jack.

One day when Dr. Billy was sitting on the side of Jack's diminutive bed, the little patient in the next bed began to cry.

"Here, what's the matter to starboard? Helm steady, old man." Dr. Billy was inclined to be nautical. "Thought I told you last night that as long as you're on the White Bed line you've got to show your nerve. Tell the captain what's the matter. We're standing by to help."

A great deal was the matter. Benny was frightened. There was a burning thirst and a pain all the way from the first mate's head to his feet, and in particular there was pain where a heavy "anchor" swung from the larboard ankle.

Crushed ice wrought a miracle in Benny's burning throat. Then Dr. Billy suggested to Jack that he, too, help the first mate. "Tell him about thumbs up, old man. You know how it helped us that morning."

So Jack revealed to the mate of his sister ship just how it is possible to hold fast to one's courage. "Just keep a-sayin' thumbs up, and pretty soon you'll be so busy you'll forget to be skeered. And you must do it, too. See, this is how."

That is the way it began. Within a week 30 little passengers of the White Bed line were playing the game. The nurses and internes played it with them. Everyone in Ward C knew the way to keep brave. Dr. Harmon heard of the success of his little patient in buying up others like him in the hour of distress. He had never forgotten the morning when Jack lay before him with his little thumbs up. He was deeply interested in the child and in the psychological element involved in the expression.

One drowsy morning four months after Jack entered Ward C there was suddenly a crackling noise outside the door. Miss Herbert, on duty, hurried to see what had caused it. She found the corridor on fire.

Quickly she turned to Jack. "Sweetheart," she said gently. The child was asleep, and she did not dare to startle him. "Sweetheart, wake up. You've got to help the lady captain. There's a fire outside, and we've all got to leave. While I run to the telephone, you think of a way to help."

Outside, the crackling noise was growing louder and curling smoke slipped in round the door. Jack's bed was the first one in the ward. He had come in by that door. He knew they would all have to leave by it. He could see Miss Herbert flying from bed to bed, wrapping blankets round each little patient.

"No, you don't!" he said, when she reached him. "No, sir, I'm going to stay till the last feller's out! I says thumbs up."

And thumbs up it was. As strong men rushed in and bore little patients, Bradford frames and all, out into the smoke, Jack lay by the exit calling shrilly, "Thumbs up, fellers, thumbs up! Don't be skeered! Say thumbs up."

He felt very drowsy when he awoke—just the way he did after Dr. Billy had put him to sleep. Some one was holding his hand, and he could hear a man's voice saying, "Bravest thing I ever knew. Dear little man!"

He opened his eyes. It was not Dr. Billy who sat beside him, but a very famous surgeon, whose eyes were misty with tears. His beard was singed and there was a gash across his cheek.

"Well, Capt. Jack, how do you feel? You were pretty brave this morning. You're a real live hero."

Jack took a long breath, and found it was a painful operation. "Why, I didn't do nothin'," he said. "I couldn't run if I'd wanted to with that anchor on my leg. I'm glad if Miss Herbert thinks I helped, but I didn't do noth-

## The Cultivator Patterns

8384—Children's One Piece Box Plated Dress. Cut in sizes 2, 4, 6, 8 and 10 years. The front of the dress is gathered to the band which edges the square neck, but the back is without gathers.

8868—Ladies' Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The back of the waist extends over the shoulders and the fronts are gathered.

8490—Ladies' Shirt Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The collar and vest of this waist is all in one.

8864—Ladies' Dress. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The dress has a two-piece skirt which is gathered at the regulation waistline.

8866—Misses' and Small Women's Dress. Cut in sizes 16, 18 and 20 years. The waist is in shirt waist style, with shoulder edges of the front gathered to the back.

8330—Girls' Dress. Cut in sizes 8, 10, 12 and 14 years. The waist is perfectly plain, with a deep V-neck in front, and the skirt is a straight, one piece model.

8871—Ladies' Three Piece Gathered Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The closing is at the left side-front.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

in', really. I just called thumbs up when the fellers went."

Dr. Harmon closed a white little hand in both of his. "You did a good deal, little man. When I picked you up and started into all that smoke, I was 'skeered to death.' But you said thumbs up, and I said thumbs up, and here we are."—Youth's Companion.

#### HOUSEHOLD QUERIES

**Canning Pimientos, Asparagus and Peas**

Please give a recipe for canning pimiento peppers; also asparagus and peas.—J. C. H., Modesto.

Complete directions will be found on Page 721 of last week's Cultivator. These canning instructions are so concise and complete that they will be invaluable for ready reference by every Cultivator housekeeper. A suggestion in regard to canning pimientos—put them in small cans. They do not keep long after opening and as they are used for seasoning and are rich one needs to use but little at a time.

#### Drying Figs

How are figs dried?—Reader, Santa Ana.

Allow figs to remain on the tree until they drop naturally; with the exception of the large ones they are then dried sufficiently to keep and are much better eating than those that are dried hard in the sun. Place on trays and stack in sunny, airy place so that the dry air can penetrate the layers, covering top layer of course from direct sun rays. After two days sort out the hard, leathery feeling figs and bird pecked and imperfect fruits, leaving soft figs in stacks until dried. Then place all perfect dried fruit together in deep boxes or bins or piles in protection of a shed where they may remain for two weeks to "sweat," or equalize the moisture. (Figs may be piled in these "sweat" boxes three to six feet deep). They should be turned over with a shovel daily if possible. After this the figs should be thoroughly washed in brine having strength of four ounces of salt to one gallon of water. Let figs remain in this brine ten to 15 minutes. Place again on trays two or three inches deep and expose to direct sun for a half day to dry off. Trays are again stacked for two days, after which time figs are ready for packing away.

#### Yeast Bread

Can I use dry yeast with wheatless bread recipes?—Subscriber, Santa Ana.

Subscriber will find two recipes for wheatless bread with dry yeast on Page 713 of the Cultivator of June 8.

#### Bread too Crumbly

What makes my cereal bread so crumbly? My recipe is: One cup of ground rolled oats, one of corn meal, one of flour, one teaspoon of salt, one heaping tablespoon of shortening, two teaspoons of baking powder, one egg, one and one-half cups of milk.—Subscriber, Santa Ana.

In using this recipe, it would help the crumbliness somewhat to use more milk, say two cups. One cup of corn meal will care for one cup of liquid. We would suggest, however, that the best plan would be to use at least half of barley or rye flour with corn meal or oat meal. They will do away with the crumbliness. Where one wishes to use wheat flour, this same proportion can be maintained. As a general rule we believe it has been found more satisfactory to make corn bread straight, occasionally, using all corn meal, remembering to use equal quantity of liquid. Then use your barley flour or rye flour in combination with rice flour or milo flour or oat meal for breads that are not in the least crumbly. There is an almost infinite variety of combinations which can be made with these and other cereals we are just becoming acquainted with, but try them alone or in combinations of two to get the individual flavors, rather than try to find one standard mixture. There is opportunity to suit all tastes.

Here is a recipe for oat meal-barley quick bread or muffins: Two cups rolled oats, one cup barley flour (or wheat flour) two tablespoons sugar,

four teaspoons (level) baking powder, one teaspoon salt, one egg, one and a half cups milk, two tablespoons (level) shortening. Pour milk over oats and let soak half hour. Add egg and melted (cooled) shortening. Add to dry ingredients which have been sifted together.

#### FIVE WAR-TIME RECIPES

Written for California Cultivator  
By E. S. F., Madera County

I am sending several recipes—using flour substitutes, which have been evolved and tested during the recent and present "period of reconstruction" of culinary ideas, consequent upon the need for conserving of wheat flour. A large cup is used in all recipes.

#### Roll Jelly Cake

Three eggs, three tablespoons cream, one cup milk, one cup each barley and white flour, two rounding teaspoons baking powder, saltspoon salt, flavoring. Beat yolks of eggs, add cream, sugar, milk and flour, into the last of which put baking powder and salt, whites of eggs beaten stiff, folded in last. Bake in sheet one-half inch thick in quick oven, spread with jelly or jam and roll while hot.

#### Easter Braids

Two cups corn flour, two cups white flour, two well rounded teaspoons baking powder, one-half level teaspoon salt, eight tablespoons sugar. Mix these dry ingredients well together. In separate dish beat well four eggs, add several tablespoons water (amount varies). Into dry ingredients rub four tablespoons each butter and lard (or drippings). Add egg and enough more water, if needed, to make a stiff dough like pie dough. Roll out one-quarter inch thick, cut in strips ten inches long and one-half inch wide. Braid three together, making both ends meet and pinching together. Place these braided circles on large greased pans and bake in quick oven. A pleasing novelty for special occasions. We make them an Easter institution for the children.

#### Adaptable Cake

Three eggs, one-third cup shortening—cream, lard, butter, drippings, oil (you pays your money and you takes your choice); one cup sugar, two cups milk, one cup rice flour, two cups white flour, into the last of which put two and one-half rounding teaspoons baking powder and a pinch salt; add stiffly beaten whites of two eggs last. Cover a large pan about one-half inch with part of batter and bake in quick oven; cut in two when cold, and place together with custard filling. Into one-half of remainder of batter stir tablespoon cocoa or same of molasses. Drop in a loaf pan alternate spoonfuls of white and dark batters and bake slowly covered at first with a butter or bread paper. Add white of one egg, beaten, to a plain cornstarch custard, flavored.

#### Doughnuts

One egg, one cup sugar, one teaspoon melted grease, one-half teaspoon salt, nutmeg to taste, two and one-half cups butter milk, two and one-half cups barley flour, two and one-half cups white flour, two level teaspoons soda. Mix to as soft a dough as can be handled, knead slightly to make smooth, roll one-quarter to one-third inch thick, cut and fry as usual in piping hot grease. Drain on absorbent paper. When cool roll in fine sugar.

#### Hot Cakes for Sunday A. M.

Three cups white corn flour, one cup white flour, or four cups corn flour alone, one and one-half level teaspoons soda or less if milk not very acid, one level teaspoon salt, one or two eggs beaten and added with milk, enough butter milk or sour milk and little cream, to make "loose" batter as usual for hot cakes.

Yes, they are holding the line, but the folks back home must bring up the reserves.

## "—use foods that require less sugar"

THIS is one of the most important recommendations of the Food Administrator: "In cooking and baking use foods that require less sugar."

In other words—use Ghirardelli's. Use it freely and wisely—in place of other less nutritious and more expensive foods. Not only will you save money but you will help in food conservation.

Cooking and baking require less sugar when you use Ghirardelli's. Because—it contains in itself the sweetening flavor you need. More than this—it adds a new touch of richness to your icings, your puddings and other desserts.

In  $\frac{1}{2}$  lb., 1 lb. and 3 lb. cans; a  
tablespoonful—one cent's worth—  
makes a cup.

D. GHIRARDELLI CO.

Since 1852

San Francisco

Ranch Foreman  
Wanted

For deciduous orchard and general farm  
in Sierra Nevada foothills; married man  
between 35 and 50 with wife willing to  
act as housekeeper for ranch boarding-  
house with four to six men to cook for;  
man must be skilled in all branches of  
farm work and in the handling of live-  
stock; experience in orchard and nursery  
work desirable but not essential if skilled  
in the other lines; must be sober, willing  
to take the lead in all work, and of a dis-  
position enabling him to handle other  
men without friction. Not a job for a  
lazy man or a crank. A good man will  
find a permanent position, every modern  
convenience in his work, best of living  
accommodations, and splendid location  
from standpoint of health. None but  
loyal Americans need apply. Give refer-  
ences and complete details of farm ex-  
perience, also state salary expected. Ad-  
dress Ranch Foreman 33, care California  
Cultivator.

## GRAIN

As to grain and feed prices see note  
under Los Angeles grain prices.  
Wheat—Government prices: Common  
white hard, base price, \$3.50 per cenal,  
or \$2.10 per bushel of 60 pounds deliver-  
ed in terminal warehouses in bulk; soft  
white, base prices, two cents per bushel  
less, or \$2.08 per bushel; white club (in-  
cluding Sonora), \$2.00 per bushel. If  
wheat, after cleaning, weighs 60 pounds  
or more to bushel, base price stands; if  
58 to 60 pounds to bushel, three cents per  
bushel reduction; if 56 to 57 pounds six  
cents per bushel less; if less than 56  
pounds, grain becomes sample grain and  
sells on its merits up to within one cent  
per bushel of 56-pound wheat. Addi-  
tional charge made for sacks.

## Citrus Fruit Market

Los Angeles, June 19, 1918.  
Spectacular market conditions still  
prevail. Eight dollar prices for fancy  
Valencias of regular sizes are not uncom-  
mon.

Grapefruit is strictly in the dumps. One  
explanation given why grapefruit is re-  
ceiving so little favor, is that the sugar  
conservation is turning people to sweeter  
fruits. If we could only induce the con-  
suming public to try salt it would soon  
prefer it to sugar.

Although a large number of lemons  
are on the way to Atlantic markets long  
prices are still being commanded.

Shipments of citrus fruits to date since  
November 1, 1917: Southern California:  
Oranges 11,124, lemons 3599, total 14,723.  
To same date last season oranges 29,729,  
lemons 5304, total 35,033. Central Cali-  
fornia this season: oranges 2527, lemons  
115, total 2642. Last season to same  
date: oranges 4417, lemons 164, total  
4581. Northern California: oranges 203,  
last year same date, 845.

Los Angeles, June 18, 1918

Bureau of Markets, United States de-  
partment of agriculture from its local  
office issues weekly statement from which  
following is taken:

Produce in moderate volume. Gen-  
eral carlot movement, with the excep-  
tion of new potatoes, not especially  
large for this time of the year. Peaches,  
cantaloupes, tomatoes and cabbages are  
moving liberally; strawberries, onions,  
old apples, old potatoes, peas and aspar-  
agus are declining in volume rapidly.  
The season is evidently one or two  
weeks earlier than last year, and ac-  
cordingly the various shipping sections  
are passing their greatest shipping ac-  
tivity at earlier dates. Total movement  
of fruits and vegetables in the week en-  
ding June 17 was 9948 cars compared  
with 7959 cars last week. The price  
trend in general was stronger through-  
out the week but declined during the  
past few days. New shipping sections  
are opening and total movement con-  
tinues to gain in volume. Florida and the  
Southern producing regions are ap-  
proaching the end of their shipping sea-  
son, while Virginia, North Carolina and  
Arkansas are becoming active. The to-  
tal movement of new potatoes was 4188  
cars compared with 2651 last week and  
with the exceedingly heavy movement  
of 2836 cars of the corresponding week  
last year. The movement of old pota-  
toes is becoming still lighter; there  
were only 617 cars, chiefly from the  
Great Lakes region and Maine. Old  
stock has nearly disappeared in some  
markets.

## Strawberries

The strawberry movement declined to  
271 cars compared with 585 last week  
and 1055 the week before. Michigan,  
New York, New Jersey and California  
are shipping in considerable volume, and  
southern and southwestern sections are  
nearly done. Prices advanced to higher  
levels, good berries being in light sup-  
ply. The seven Southern states are  
finishing their season with less than  
two-thirds as many as they shipped last  
year. The ripening season was unusu-  
ally early.

## Peaches

Total shipment of peaches this week  
was 748 cars compared with 321 last  
week. Demand was moderate at ship-  
ping points and in northern consuming  
markets.

## Cantaloupes

Shipments of cantaloupes again in-  
creased abruptly, to 1284 cars compared  
with 598 last week and 172 the week be-  
fore. Movement was mostly from Cali-  
fornia and prices for California stock de-  
clined heavily under steady supply, clos-  
ing the week \$1.25 lower at range of  
\$4.50 to \$6.25 for standard crate in lead-  
ing markets. The price range was lower  
than that prevailing for the correspond-  
ing week last year but was \$1.25 higher  
than for the corresponding week of 1916.  
Cantaloupes sold the last of the week at  
\$2.50 f. o. b. Imperial shipping points.  
California 45s standard crate ranged  
about as at present for the corresponding  
week of last year and sold about \$3.00  
above the comparable week of 1916.

## Raising Chicks Without Heat

Written for California Cultivator By Jean A. Koethen

**A** CORRESPONDENT writes: I have seen open-air brooders used several years ago with good success. I think it was the Philo system or brooder. Can you give me any information about it?"

Can I? Was I not one of those misguided persons who paid a perfectly good dollar for a copy of "The Philo System of Poultry Keeping?" And did I not break my back trying to take care of my chicks in those beautiful but impractical coops which require the caretaker to get down on her knees and stick her head under a six-foot wire frame, holding its weight on her shoulders, every time she wants to catch a chick? To be sure, one might prop the wire frame with a stick, but the chicks soon learn to find the least opening, and out they go. Then, when the system proved too much for flesh and blood, and the daily cleaning was omitted, did I not see my chicks die off, one by one, in the agonies of wryneck, caused by eating the moldy bran in the bottoms of the coops? The Philo system of poultry keeping has some admirable virtues. I have seen it worked successfully by several persons. Some two or three years ago I saw, not more than a mile from my own home, a man using several coops, 100 chicks in each coop. They were only a few days old, and seemed very comfortable, with the warm sun streaming through the open top, and every breath of wind excluded, but I wonder what he did when they were a month old. One hundred chicks at that age require at least two coops, and by the time they are three months old they would need five or six unless the coop was kept in immaculate condition.

The principle of the Philo System is all right. Given a warm, sunny coop sheltered from the wind 25 chicks or more can keep each other warm at night, and they soon learn to go inside to warm up if the day is chilly. The one objection to it is the immense amount of hard work it involves. For an occasional brood of 25 or 50 chicks it is quite practical. For a large flock where hundreds of chicks are to be raised the labor involved is out of the question.

It is quite possible, however, to raise chicks without heat and without the cumbersome coop which is characteristic of the Philo system. The little Philo brooder, which is merely a box 13 or 14 inches square, and from five to seven inches deep, filled with good soft litter and covered with a warm quilt, has come to stay, and is used successfully by many poultrymen. In the colder spring months it is hard to manage, for it ought to be

in a warm room, but in May or June or September it can be used in any sheltered place and keeps the chicks perfectly comfortable. The only requisite for its use is, that it contains not less than 25 chicks; for a smaller number cannot keep each other warm! If it is made a little larger than 14 inches square it will hover 50 chicks for a month. Sometimes it is made large enough for 100 chicks, but the smaller flocks do rather better, as a rule. They do not so quickly overcrowd the brooder.

My own scheme for using the fireless brooder has been to partition off with 12-inch boards the southeast corner of the feed house. A pane of glass in the south wall at the floor level lets in the sun nearly all day. If there were another pane in the east wall, the sun would shine in from early morning till sunset, but this is not necessary, for after the first week the box is carried out into a sheltered yard and the chicks have a chance to run till 4 o'clock. Then they are carried back and can play before the south window till bedtime. Carrying the box in and out is some trouble, but in the late spring it is not necessary for long. If the weather is fairly warm the chicks by the time they are three or four weeks old can be left outside in a small coop or a dry-goods box placed on its side. If the night is chilly this is curtailed with burlap, but it is surprising how very warm 25 chicks a month old will keep each other in an open coop. It is surprising, too, how little protection chicks need that have always been accustomed to the open air. The hen-brooded chick after the first week in comfortable weather asks for very little hovering, often for none at all. If it has the sun during the day and its mother's wings at night it is perfectly comfortable and makes a more vigorous growth than the chick that is brooded by artificial heat. After all chicks are very like the rest of us; the more we are accustomed to heat or clothing, the more we require.

But the person who undertakes to raise 50 chicks in a fireless brooder has her work cut out for her the first week. I use the feminine pronoun because the fireless brooder, for all it was invented by a man seems especially adapted to female use. How

many men have the patience to mother a brood of 50 chicks through the first trying week from the minute when as little helpless, chilly, things, astonished at this big cold world, they are put under their blanket for the first nap? How many men would take the time to coax them out to eat, then gently push them back to warm up and rest, fastening them in till it is time to let them out again, doing this four or five times a day for a week till they are fully "brooder-broke" and have learned where to go when they are cold and where to find their food and to eat and drink and scratch. To be sure there is always a good deal of care when chicks are brooded with heat. With the fireless brooder there must be constant watching the first week. The caretaker must imagine she is the hen-mother, and coax and fuss over the chicks till they have found themselves. Perhaps I exaggerate the mothering required, but I do hate to see little chicks die, and no fussing seems too expensive if only they are kept alive through that critical first week.

I have said so many times that warmth is the first essential in raising chicks that it seems stupid to repeat it, yet only a few days ago a friend, the wife of a college professor, called me up to ask why her chicks were dying. They were with a hen, surely she could keep them warm, for all there were 20 of them, and she was left right out in the wind all day, with a small coop set over them all at night. How could any hen keep 20 chicks warm under such conditions? Chicks must be protected from the wind. I would rather raise a brood with a fireless brooder in a warm, sheltered corner of the feed house, than leave them out in the wind with the best hen that ever lived. The thing is simply impossible. No hen can protect her brood without a windbreak. Warmth is the thing. How you secure it doesn't matter much. It may be with the fireless brooder; it may be around a jug of hot water; it may be about a big brooder stove. Don't think because you have a good hen, or the best make of brooder that therefore the chicks must be comfortable. They are comfortable when they are amply warm. They sleep when they are warm and only when they are warm. They cannot digest their food if they are chilly. Warmth is first and second and third. Keep them warm somehow, no matter how. But keep them warm.

ers was raffled and the proceeds placed in the treasury of the association.

**THE SELF-OILING WINDMILL**

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

## Save Eggs for Season of High Prices

By R. F. Palmer

It is becoming more and more necessary for both the producer and consumer to hold eggs over from the season of plenty to the season of scarcity, from the season of low prices to the season of high prices. One egg next winter will be worth as much as two and perhaps as much as three eggs at the present time. There is every indication that eggs will be even higher next winter than they were last. For that reason it will pay the producer and the consumer to find some method of preserving eggs at present prices. Next to cold storage, we have had best success by preserving in water glass, (sodium silicate.) We are also trying out two or three commercial preservatives, and the indications are that they will prove equally as satisfactory.

You should first prepare your preservative, even before you get the eggs. The water glass solution is made as follows: Use 12 times as much water as you do of the water glass. In other words, to each 12 gallons of water stir in one gallon of the water glass. If you have only a few eggs to preserve, use a smaller quantity, but in this proportion. The water should be boiled and then allowed to cool. When it is just lukewarm, you begin to stir in the water glass. You stir until it is thoroughly mixed. You are now ready for the eggs.

As a container, we use earthen jars, candy buckets, kegs or half barrels. If you use wood see that it is thoroughly cleaned and odorless. The eggs should be clean and fresh. One bad egg may spoil the lot. Place them in the container with the small end of the egg down. Then pour in enough of your solution to cover the top eggs

about two inches deep. The following day or just as the eggs are gathered, more eggs can be placed in the same container and more of the solution poured over to cover them. You can continue this process until your container is filled. See that the top layer of eggs is well covered with the solution and if there is any evaporation the container must be refilled. Cover it over with a heavy cloth and tie it on. Lay a clean board or weight over it to protect same. Place them in a cool place, cellar or basement, and they will keep for several months. White eggs preserve as well as brown eggs.

The eggs are good for any purpose, but if you wish to boil them, a small hole should be punctured in the large end of the egg before placing it in the water. In all instances, wash the eggs in water before using.

**CALIFORNIA RABBIT BREEDERS' ASSOCIATION**

The California Rabbit Breeders' Association, formerly the California Pet Stock Breeders' Association held its annual meeting May 26 at San Francisco. At that time the new officers were installed as follows: President, Mrs. L. B. Hackett; first vice president, C. A. Wilkins; second vice president, E. I. Pike; secretary-treasurer, C. J. Williams; governors, C. P. Gilmore, Hale Prather, Mrs. C. A. Eichey, M. L. Thayer, Geo. B. Nugent, E. F. DeLaMater, and Henry A. Hoyt.

A table show was held at the conclusion of business meeting with the official club judge passing upon the merits of specimens. Stock donated by E. W. Cole, Hale Prather and oth-

## Linking Farm and Market

Transportation is an increasingly vital factor in the farming industry.

As farm crops become more diversified, the markets must be studied more carefully and reached more quickly.

Profitable farming has found a wonderful aid in motor transportation.

Power-driven vehicles on rubber tires have greatly widened the possible market that can be reached from any given point.

They have made timely marketing possible, enabling the grower to take advantage of price changes.

They have cut to a minimum the time used. What was formerly an all-day trip now requires but a couple of hours and leaves the horses at their work on the farm.

Using motor vehicles for business reasons, it is important that you

treat their equipment in business fashion.

Buy tires on the principle that long and continuous service is the first requirement.

In this year of war, your time and efforts are more important than ever before. You need your car more. Your tires must be dependable.

Equip with United States Tires.

Use them for the same reason they are chosen by big commercial companies having large fleets of cars—because they give greater mileage per dollar of cost and permit maximum service from the car.

There is a United States Tire scientifically built to meet every condition of service.

One of the thousands of United States Sales and Service Depots will cheerfully aid you in selecting the right type and tread.

'Chain'

'Usco'

## THIS WEEK'S COVER

The Liberty Bell is ringing again as it never rang before. Its clear notes reach far beyond the belfry of old Independence Hall, in fact, far beyond the boundaries of the country which is glad to extend the liberty which it has secured for its own people. This year's Fourth of July will be the most glorious of all though there will be less of spread eagles and less of boasting as to our accomplishments and more of serious thinking as to these, the most wonderful days in the history of the world. The problems are great, and America is meeting them nobly.

## FORWARD

We often hear inquiry as to the attitude of former peace advocate David Starr Jordan toward the war. He has said and, we understand, bears it out in actions: "Now that we are at war, the shortest way out is forward."

## DON'T BURN IT

Many a night we have seen the illumination of the sky from thousands of miles of burning bean straw. We have appealed through these columns and elsewhere for the stopping of this waste. Now comes war and the waste will be stopped, for the federal government has taken a hand and hereafter the burning of these

valuable feeds will be a criminal offense. Even the citrus orchard may not use it as a mulch until its feeding value has been obtained.

## SAVING STRAW?

Are we saving the straw and even the weeds which have feed value? California will need every morsel this year. Live stock men are appreciating the seriousness of the situation. Those who have lands not used to better advantage should plant the sorghums, especially Sudan and all crops which will give roughage. Bear in mind the food administration will take cognizance of every violation of its order to save. The food and the feed slacker have possibilities of a penitentiary sentence.

## BOYS—FIRES

In Colorado a number of boys who were too young to understand the seriousness of a mountain fire were permitted to go into the mountains without guardians, and disastrous fires were started as a result. The boys were jailed and will doubtless suffer, or their parents will, and the fire continues to burn. The last place for children to play with fire this year is in the mountains.

Speaking of fires, if we are smokers, let's not when in the dry fields or working in inflammable stuff. A carelessly thrown cigarette stub or the emptyings of an old pipe have caused many a serious loss; let's forego this year.

## WAR SAVINGS SOCIETIES

W. S. S., which mean War Savings Stamps or War Savings Societies, have been magic letters for the past seven days. The campaign has been on with much vigor, and from reports in many sections with not as liberal returns as were expected. Too many have considered W. S. S. as standing for child's play rather than for the serious work of building merchant marine, but the need of our country is no greater than along the line of the merchant marine, and the two billion dollars is needed, every penny of it, for payment on these ships which are to be delivered before December 31, 1918. But note again: W. S. S. stands for more than two billion dollars. War Savings Societies, which should number in their membership a hundred million people, have taken this pledge:

"I further pledge myself to save and economize to win the war."

"Save and economize" means pennies, more, it means now lumps of sugar and cups of flour.

The W. S. Stamp campaign may end soon but the W. S. Society campaign must not end till the history of the World's Great War is being written.

## SLACKERS

We do not believe there has been a time since the war began when California farmers have felt the sting which comes from unjust treatment as at this moment. After answering the call to buy liberty bonds, war savings stamps, aid Red Cross, Y. M. C. A. and other activities, and also responding to the call to produce food for starving peoples, the farmer is today confronted by a situation which prevents him from getting his foods to those who need them. The Imperial Valley is stacking up thousands of tons of barley and other grains for which no opportunity, or at least little opportunity, is offered for dis-

posal. Potato growers are saying, "Never again."

And latest, the apricot growing sections are faced with enormous loss or with taking last moment offers from dry yards and canneries. When appeal is made to those who are fitted with dry yard appliances to make a reasonable offer for the fruit, buyers have simply thrown up their hands and charged to the food administration a condition "which prevents us from buying." This has been taken up with the food administration, and complete denial is made as to any order which would prevent handling of apricots or any other crop on a basis which would permit of reasonable profit. But profiteering has been prevented in the interests of the consumer, and it has resulted in backing the situation up to the grower from whom it seems to be considered that the profits can be squeezed without hindrance.

Some apricot producers are buying trays or buying shake or other material and making, but without other appliances for handling the crop, which ripens within ten days or two weeks, and with the inability to handle the large amount of labor required, the loss will be very great unless some steps are taken to aid these people. A great quantity of California's most healthful fruits may be lost.

## Y-O-U

Individual responsibility for the success of our arms in this war has not been fully appreciated. We have told ourselves that we could not be too serious or we would become despondent, hence we must have our pleasures and follow our even tenor of life so far as possible. The editor of the Saturday Evening Post remarks:

"Before you can win in France you must take Broadway and all the little Broadways of America in hand. You must do something to the swine soul of the crowd that leads the jazz life; that swills and guzzles as usual; that brags as if its \$50 Liberty Bond were engraved in its heart's blood; that cheers everything, including the chorus that comes out in American-flag petticoats; and that proves its patriotism by its hoarseness and its alibi buttons."

More, before we win in France, we must take a greater personal responsibility upon ourselves. "We must be fired with the old American pioneer spirit, each shouldering his share of the burdens of the long trail. There can be no vicarious sacrifice. We must go to it with one big boss, one big people and one big punch. Then—You will win the war."

One of the steps which we, you and I, must take, is to devote a bit of our time between now and election day to informing ourselves as to the qualifications of congressmen and others asking for our suffrages. The candidates may be patriotic; they may be honest; they may be men of great intelligence; but we must have all combined. Our congressmen, as well as our president, are holding the lives of our boys in their hands, and we must have men with ability to see and to quickly decide the great questions before us. For once in the political history of this country we care not whether a candidate is a Republican, a Democrat, Socialist or what not politically.

## This Week's War Notes

"Drive to Berlin through Austria-Hungary" is the latest slogan.

The new war freight rates have been in force since last Tuesday.

Presumably congress will soon make declaration that a state of war exists between the United States and Turkey.

Brazilian war vessels are aiding in the patrol of the Atlantic and are most helpful convoys for American troop ships.

Because of sub destruction of millions of pounds of sugar appeal is made to all the people to save sugar as never before.

A movement has been started to secure signatures to a pledge that the signer will purchase no German made goods. Such a pledge is unnecessary.

London reports city of Irkutsk, Siberia, captured by Alexieff, former Russian commander in chief. He is in command of Czecho-Slovak troops.

The Fourth of July will be celebrated this year by the launching of more vessels at many coast points of the United States than ever slid into the water in the history of the world.

The suggestion has been made that Central and South American troops be officered and drilled in this country, later to take their places in trenches with the Allies on the western front.

The number of American troops in France is not definitely known but the war department has announced that it will not be long before the number will reach 1,000,000. There is no day now but vast numbers are leaving for France.

A dispatch from Copenhagen states that Nicholas Romanoff, former Russian emperor, has been murdered in his reprimand at Tobolsk. Another dispatch from Berne, Switzerland, quoting from a German paper, states that the former Russian emperor has been transferred to Moscow.

The Allies are passing the Russian situation up to the United States. It is possible intervention may take place and it is thought a movement is on in Russia which will make possible the sending of Allied troops to aid the Russians in redeeming their country. There are 35,000 loyal Russians who still retain their arms and are ready to oppose the Bolsheviks, especially Lenine and German sympathizers.

The Allies are watching the internal situation of Austria-Hungaria with interest. There have been strikes and riots which have resulted in much bloodshed. The rioters charge that the food is all taken to Germany and that they are starving. General Ludendorff has been sent and given absolute power. It is generally considered that Austria's emperor is now only the vassal of Kaiser William. It is believed that Berlin finds it necessary to sacrifice her ally in order to save the western front.

The Italians and the Allies have won a glorious victory. All is still confusion but it appears that with the loss of well up toward 200,000 men, 50,000 of whom are prisoners, the Austro-Hungarians are in a disorganized fight. Vast stores, especially large guns including many which were captured by the enemy in their plunge into Northern Italy some months ago, have been taken. The Italian troops have been in fine spirits, have fought valiantly, have been aided by French and English reserves. It is also reported that American flyers have rendered much assistance. Italian cavalry has been effective in cutting off the escape of many of the Austrian troops. The victory has been made greater by the flooded streams which have cut off the retreat. The only report made by General Diaz, commander in chief of Italian armies, is, "Yesterday, we obtained a great victory."

The western front gives occasion for great hopefulness to the Allies. Excepting in front of Rheims, there have been only light raids during the past week but all gains have been on the part of the Allies. Artillery action has been almost incessant and American gunners have won many compliments. The heaviest assault of the week in the Rheims sector was on the line held by Italian troops. It is rumored that promises were made German soldiers of entire freedom of the champagne cellars in which millions of bottles of champagne are stored. However, the defeat of the Germans has been complete. The German program has been made more difficult by the Piave defeat. Last moment advices indicate a massing of Teuton troops for the mightiest of all onslaughts on the Western front. Intelligence service and air service unite in reporting great masses of troops only a short distance behind trenches. Immense ammunition dumps have also been placed and new field hospitals erected.

# Winter Injury to Fruit Trees Common This Year

WINTER injury is particularly prevalent this season in Southern California. Many orchardists have complained that their fruit trees did not leaf out well and have not made a normal growth this spring, with the result that the crop prospect is not very bright. This condition seems to apply particularly to the early varieties of peaches. Walnuts have suffered to a very large extent this season from winter injury. Orange trees, especially those situated on the lighter soils, are not looking normal and in some cases are not setting much fruit. The per cent of summer lemons in some sections is below normal. Many grape vines put out a weak straggly growth and are gradually dying.

Most of the abnormal behavior referred to seems to be the direct result of the abnormally long, hot, dry fall of last season. California growers must get away from the precedents established in the fruit districts of the Northwest and the East. In these sections, with the coming of cold weather the trees mature their wood and go dormant for the winter. In parts of the Southwest, especially in Southern California, our winter weather is not sufficient to make the trees mature their wood and go dormant. In fact, the gradual depletion of the soil moisture toward the end of the growing season is probably the most important factor in making the trees cease growth and enter a dormant condition. In a normal season, this depletion of soil moisture does not reach a dangerous point before the setting in of winter rains, accompanied by relatively cool weather, which prevents the trees from leaving the dormant condition until warm weather occurs in the spring.

Last season was exceptionally long and dry, with good growing weather until nearly Christmas, and where the trees were heavily irrigated they did not go dormant until very late in the season but retained their leaves long after the period when they normally

Written for California Cultivator  
By Robert W. Hodgson

would have shed them. The result was that they largely exhausted the food reserve which had been stored up in the trees for the development of the buds and leaves in the spring, and when spring came they put out a weak sickly growth which did not bear strong healthy blossoms. This same condition is frequently occasioned with almonds by an attack of red spider which accomplishes the reduction of the leaf area during the summer when the food reserve is being laid up.

With walnuts, considerable winter injury was caused by the trees growing late and being frosted. Succulent

walnut shoots are very tender to frost and a very light frost is sufficient to injure them. The injury may not show up until spring. This type of winter injury is largely confined to orchards situated on lands of low elevation, and more especially where the water table is high, which provides conditions favorable to late growth. Of course, a certain amount of dying back in walnuts can be attributed to the heat wave of last season.

However, even in orchards which were not late irrigated, there was considerable winter injury which may be laid to the extremely dry atmospheric

conditions prevailing last fall. The wood was properly matured but the soil moisture was depleted to an injurious degree long before the winter rains set in. For several months the weather was extremely dry and warm after the trees had gone dormant, and they simply dried out. This type of injury occurs quite frequently in deciduous trees in the Great Plains area, due to the prevalence in some seasons of dry winds during the winter which desiccate the smaller limbs, resulting in their dying back in the spring. Winter injury of this kind is common to the apricots in the Hemet section and to the walnuts on the higher lands, and may be found in dry farmed sections quite generally.

The prevention of winter injury in California is largely a matter of intelligent irrigation. Copious winter irrigation is always dangerous in regions of mild winter climate for the reason that it may keep the trees from going dormant at the proper time, or if they are dormant it may induce them to leave this condition, especially if the weather is warm. Toward the end of the growing season water should be withheld to induce the trees to mature their wood and go dormant, but trees should not be allowed to dry out. If the winter remains dry they should be given a light to moderate irrigation depending upon temperature conditions.

In the case of lemons, winter irrigation during exceptionally dry seasons is of the greatest importance because they are evergreens and do not go dormant, and in addition are always setting a new crop. However, our experience with citrus trees in general has indicated that, due to their lack of economy in the use of water, during periods of extended dry atmospheric conditions considerable shedding of the fruit may occur though soil moisture conditions are optimum. It is needless to point out, however, that where the soil moisture is deficient the loss from shedding is much greater than where the soil is well supplied with water.

Winter Injury on Walnut

Tree showing serious injury on many branches. This condition in many orchards is calling for investigation on the part of experts.

## The Rating of the Tractor

WE HAVE heard tractor salesmen make complaint because operators have expected too much and put too big loads on their machines. One farmer was found guilty of using big disk gangs, with pulverizer, drill and harrow, which should have had a tractor of nearly double the capacity of the one used. The farmer got away with it for a short time.

We have also heard the farmer complain because machines sometimes do not come up to their rating. This question has been investigated by the editors of the Farm Implement News, who say:

"Those of inquiring mind will make comparisons, and one of the first things that will strike the investigator is the discrepancy between the ratings of many machines using engines of identical size and make. While allowance must be made for efficiency in power transmission to the rear wheels or track, those elements being approximately equal, it is self-evident that one machine will develop as much power as another if the same motors are used and operated on the same fuels at proper engine speed.

"The reason for some of these dis-

crepancies is that certain manufacturers or their advertising men have overrated their machines. When Farm Implements News sent its data sheets to tractor manufacturers it was careful to specify that the ratings should be those recommended by the Society of Automotive Engineers as standard, for they are the only safe ratings to use. The standards adopted by the S. A. E. are as follows:

### Drawbar Rating

"The drawbar rating shall be 80 per cent of the horse power that the tractor is guaranteed to develop at the drawbar continuously for two hours, the tractor being in good condition and properly operated at rated engine speed. The tests should be taken on ground sufficiently firm to give the traction wheels a good footing, a firm sod being preferable.

### Belt Power Rating

"The belt power rating shall be 80 per cent of the horse power the engine is guaranteed to deliver at the belt pulley continuously for two hours, the engine being in good condition and properly operated at rated engine speed.

"It is apparent that many manufac-

turers have not followed these recommendations, and if the circumstances are not known it puts the conservative manufacturer in an unfair position. Here is the way the situation impresses the Port Huron Engine & Thresher Company in a letter received April 24 from A. E. West, the general manager:

"We are this morning in receipt of a copy of your Tractor Field Book, and in reviewing the specifications on pages 60 to 63, we feel that we have gotten the worst of it, as compared with others, in our drawbar and brake horse power ratings. In your specification sheet you particularly call for these ratings S. A. E., and we were very careful to deduct 20 per cent in arriving at ratings included in our specification sheet. Apparently others have not done this. This puts us in a rather peculiar light because others using identically the same motor we are have not observed the same rules in determining their ratings, and while we understand this, I am not so sure that the prospect, dealer or customer, would be as careful to analyze the situation as this."

"If the editors of this publication have learned anything about tractors

in their sojournings among dealers and conversations with them, it is that more tractors are 'killed' in many sections by overrating than by any other one factor. We know of one section in Wisconsin where a tractor, which we shall call the Billdab because that is not its name, can hardly be given away, let alone sold. And it all came about because the first ones sold were overrated. Farmers found that they would not stand up when loaded to the recommended pull and condemned the machines as worthless for that reason. Other tractors have since been introduced in that section, but the manufacturers and salesmen were careful to understate their abilities rather than overstate, and the result has been that the later comers are reaping the permanent trade and profits.

"For this reason we have no fear that concerns which follow the safe, conservative course, the S. A. E. standard one, will suffer in the end. It will be just the other way. The commonest boast among farmers owning tractors is that Bill's 10-20 will outpull Jim's 12-24. The capability of the underrated machine is enthusiastically

Continued on Page 774

# Agricultural News Notes of the Pacific Coast

## Northern California

The warm weather has materially improved the prospect for a bumper rice crop.

Glenn County Live Stock and Agricultural Association is planning for its fair to be held at Orland.

The wheat district about Chico, Butte County, shows about two-thirds as much wheat as in 1917.

Farmers generally over the Sacramento Valley are finding it necessary to sink wells and install private pumping plants.

Placer County board of supervisors has passed an ordinance requiring all tractors and other engines to use spark arrestors.

The state board of education is conducting training classes for agricultural teachers at the University Farm, Davis.

Yuba County is installing a large number of private pumping plants to give supplementary irrigation systems.

Thirty-one breeders of Duroc-Jerseys recently met at Placerville and organized an El Dorado County Duroc Association. Dr. L. J. Anderson of Placerville is secretary.

The district attorney of Humboldt County is calling attention of live stock growers to the state law regarding running of stock on the highways and has caused several arrests for violation.

The California Pear Growers' Association is now fully organized. Frank T. Swett is president. The crop this year will not exceed 70 per cent of last year's crop but the price presumably will be higher.

The California Cattlemen's Association has arranged with Ralph Merritt for the grazing of Yosemite Park lands during the present season. It is estimated that it will accommodate 20,000 head.

A meeting at Fresno of the independent dried peach growers of the valley, which was followed by another at Yuba City on the 11th, was for the purpose of passing on a plan of fixing maximum price for dried peaches and to gather an idea as to output for the coming year.

The labor difficulties in the asparagus growing districts along the Sacramento River have resulted in great loss in harvesting, and many deliveries which were anticipated will not be made. Over 1500 acres were not cut at all and other sections have lost greatly because of shortage of labor.

An electrical storm in the mountains of Tuolumne, El Dorado, Trinity, Lassen and Siskiyou Counties has been followed by outbreak of scores of fires, and district foresters and rangers have had a strenuous time in the endeavor to bring them under control. Several suspects have been arrested with the idea that they may have been the cause of starting some of the fires.

The McCloud River Lumber Company has agreed with the United States forest service to give compensation for its service of detecting and suppression of fires which may occur on some 275,000 acres belonging to the company, largely in Siskiyou County. In addition to this compensation, the company agrees to maintain a special fire fighting crew to be under command of the fire agent of the forest service in time of need.

## Central California

Denair, Stanislaus County, farm center has established a labor bureau.

Stanislaus County is planting a large acreage to honey sorghum.

Kings County farm bureaus are investigating labor housing conditions.

The first car of cherries from Tulare County brought \$8000.

Harry Drobish will become the acting farm adviser for Madera County. He was formerly in Riverside County.

Farmers of Tulare County are protesting before the board of supervisors the high costs of squirrel killing.

The Kern County farm bureau holds auction of fat hogs Friday of this week.

Minimum wheat price of \$2.00 per bushel has been made free on board cars at all California points.

Patterson, Stanislaus County, is complaining because of inroads of the grasshopper pest.

Over 10,000 acres of grain hay have been cut near Visalia, Tulare County. Many maintain this could have been made good heavy grain.

One live stock man in Salinas, Monterey County, recently shipped six cars of fat cattle to Los Angeles packing houses.

The Tulare County board of supervisors is discussing discontinuing work on the highways until after the war.

The "Stanislaus plan" of financing farmers is expected to greatly increase California's production of wheat next year.

Kern County farm bureau has reorganized its marketing department. Its most successful work has been in public sale of fat stock.

The Cattlemen's Association of California has tabulated the returns of Monterey County's assessor and has list of owners of all stock in that county.

Contractors and caretakers of non-resident owned orchards in Tulare County are raising prices of contract work from \$30 to \$40 per acre. Some are asking \$45.

The food administration has fixed a price of ten dollars per ton on Monterey Bay sardines. The maximum allowed to each fishing outfit is ten tons.

Owing to complaints as to Fresno County's using quantities of road oil which has a certain value as fuel oil, the board of supervisors has asked investigation from the federal oil director.

Peach growers of the San Joaquin Valley, have been asked to burn no peach pits; the war department is using them in the manufacture of charcoal which is used effectually in the preparation of gas masks.

Stanislaus County merchants will furnish fire extinguishers to farmers at cost, and the farm bureau has organized practically every community into fire fighting organizations. There will be no center meetings during the month of July.

The California Peach Growers' Inc. and the Tulare County Canning Peach Growers' Association have fixed on the prices for canning peaches: Clings, \$65 per ton; Freestones, \$45 per ton. This is \$5.00 to \$10.00 lower than anticipated this spring.

## Southern California

Chino, San Bernardino County, is planning the installation of a large bean cleaning plant.

A freak summer shower has proved of great benefit to beans in the district of Tustin, Orange County.

Valencia oranges continue to command prices entirely satisfactory to the producers.

Fred Rafferty, labor examiner for Orange County, reports more laborers than he has employers.

Southern California farmers have borrowed up to this time over \$2,000,000 of the national farm loan.

Los Angeles County farm advisers have been giving demonstrations in citrus pruning.

Buckwheat as a green manure crop is declared to have saved many an orchard from June drop.

The handling of drying apricots has already begun in many sections. The fruit will be earlier than last year.

The board of supervisors of Imperial County has passed formal resolutions urging farmers to plant extensively of milo.

Imperial Valley cantaloupe growers have had a good season and have shipped out some of the finest fruit and the best pack of any season.

Los Angeles farm bureau now has a cow testing department. Geo. E. Knight has been secured as official tester.

Potatoes have been moving fairly freely, but some growers, especially in San Diego County, have been holding off digging, hoping for fairer prices.

Members of the California Prune and Apricot growers' Association in Hemet, Riverside County, are working for a 100 per cent membership in that organization.

Arlington poultrymen have contracted for delivery of eggs to Los Angeles at 27 cents per case. This is five cents increase over last year's rate.

Riverside County has another farm adviser. A. L. Paschall, formerly of Arizona, has retired on account of health, and R. N. Wilson has been appointed.

Fish canneries at Long Beach have been compelled to close because of fish shortage, the Japanese fishermen refusing to deliver fish at the maximum price fixed by the fish administrator.

Many walnut sections are finding serious "winter injury" from which a large number of trees have been killed back. This is generally conceded to be due to the dry condition of the soil in early winter or to ill advised irrigation.

The San Diego County board of supervisors has appointed five fire wardens who will have charge of fire fighting operations in the different parts of the county. They will be under the direction of Forest Supervisor Phillipson.

The farm center at Arlington, Riverside County, which is largely made up of poultrymen, recently devoted one center meeting to discussion of poultry questions and decided that the hen must produce at least an average of 127 eggs a year to pay for the grain she eats.

## The Coast and General

Texas acreage of tomatoes will be materially short of that of last year.

Practically all walnut growing sections are predicting normal crop.

Chandler, Arizona, is shipping honey to France.

The great liberty loan parade in Manila ended with the purchase of six million pesos worth of bonds.

The hot weather in some of the corn belts has caused serious damage to corn crop.

Alfalfa growers of Chandler, Arizona, are forming cooperative marketing association.

Orchards on the hillside near Sierra Madre are being planted to alfalfa in the hope of improving soil conditions and preventing washing of terraces.

A traffic committee is to have entire charge of all freight matters in the state of California, Nevada, Utah, New Mexico and Arizona.

The Idaho state council of defense has asked the federal government either to pay farmers for wheat when placed in elevators or to finance the farmers.

Idaho's fruit crop will be materially short of that of last year because of heavy freezes occurring toward the end of May. It will not be the total loss first anticipated, but it is estimated now to be 25 to 50 per cent.

The production of sugar cane is being encouraged in Persia. Formerly it was a great industry, but during recent years it has been allowed to lapse.

One Utah farmer after careful observation in tractor management in general farming declares that one man with tractor has done the work of two men with six horses.

Another assistant farm adviser has been appointed for Los Angeles County, R. E. Nebelung of Anaheim. His work will be largely with citrus orchardists.

The cow testing association of Stillaquamish County, Washington, reports 480 cows averaging 826 pounds of milk and 36.22 pounds butter fat per month. The average feed cost per cow is \$5.41. The best cow in the association produced over 70 pounds fat.

A Nebraska farmer, dissatisfied last fall with the 800 bushel return from 32 acres of wheat, at odd times during the winter ran the straw through the separator a second time. He obtained 75 bushels which sold for \$187.50. There had been a waste of 9.3 per cent of his crop.

There will be a dairy show held at Alger, Montana, June 22. The Interstate Fair at Spokane, Washington, has chosen dates of September 2-7; Montana state fair, September, 9-14; Idaho state fair at Boise, September 30-October 5; Northwest Live Stock Fair, Lewiston, November 7-13.

A housewife in the cocoanut growing section of Mindanao, Philippine Islands, reports method of making cocoanut butter by finely grating meats of four cocoanuts, pouring over it ten cups of boiling water. This "milk" is allowed to remain over night to set when the "cream" is skimmed off exactly as from cow's milk. The "cream" is put in ice cream freezer for two hours, when it is churned as ice cream is ordinarily frozen.

# Waterfowl on the Farm

Written for California Cultivator by Jean A. Koethen

GESE and ducks, like turkeys, are much better adapted to the farm than to the backlot or small suburban place. Like turkeys they can be raised in confinement, but the cost of keeping them under such conditions is so great that there is little if any profit in it. On the farm where they can forage for part or all of their ration, eating what would otherwise go to waste, they can be kept with no small profit and require but little care. Every farm should have a few ducks and half a dozen geese. If it happens to be in a river bottom or has a little stream running through it, conditions are ideal for both.

There are half a dozen good breeds of ducks. For eggs the Indian Runners are best. I am told that many persons prefer Runner duck eggs to hen eggs. The price they bring in the markets is about the same, however. If ducks are wanted for meat, there is probably nothing better than the Pekin, which weighs four or five pounds at ten weeks of age. The Muscovy seems to be coming into more general favor as a general utility duck.

The hatching season for ducks begins in January. Runner ducks usually begin laying in the fall and continue well into the summer. For Pekins the laying period is much shorter. A breeding pen of ducks consists of one drake and four ducks. The eggs require 28 days for hatching and may be hatched either in incubators or under hens. When they are hatched in incubators the temperature must be kept a little lower than for hens' eggs, and more moisture is often recommended but seems not to be always necessary.

Ducklings do better than chicks in fireless brooders. In fact, in this climate they are seldom given artificial heat. In chilly weather it is better to take the brooder indoors at night for a week or two or to keep it in a closed coop. They must be kept penned, for they do not seem to have the sense of locality that chickens and turkeys have, and will wander away and lose themselves. They are also a tender morsel for squirrels and gophers, which will eat ducklings when they would never think of touching a chick.

In one respect ducklings are more easily raised than chicks. They are less susceptible to disease. Keep them out of the hot sun and from getting chilled or wet the first two weeks, meanwhile feeding a soft mash with a little sand to help digest it, and your duckling is as good as raised. Vermin do not attack them as long as they have water to dip their heads in, and while their brooders and pens should be kept reasonably clean there is no need of the scrupulous cleanliness chickens require. In fact, it is hard to see just how one would attain that scrupulous cleanliness with ducks, for they must have water, and where there is water there is also mud.

I suppose one reason why the duck has such a small place in the affections of the average farmer is that it is not a friendly bird. Little or big, you cannot pet them. Chickens soon learn to climb on the shoulders and knees of their caretaker; turkeys and goslings follow him from the first day. Ducks run away. They are timid, frightened to death at a stranger, so shy and nervous that in some large duck plants lights are kept burning all night. Nevertheless,

they are good eating, quick to mature, and, for those who have range, cheaply raised.

Ducklings are not fed till they are two days old. They will not eat earlier than this if food is offered them. A good first feed, given the morning of the second day, consists of cracker or bread crumbs scattered over fine sand on a board. At least this was a good feed before we began to Hooverize. Now cracker crumbs

them, as it should be after they have learned to eat heartily, it will take the place, to a large extent, of the animal food, and will hasten growth. When only a few ducks are kept they may be allowed to range when they are old enough, and will pick up most of their green feed. The mash, however, should always contain both greens and sand.

The ration of breeding ducks is similar to that of the ducklings, except

Aylesbury Ducks

are out of the question, and no one would think of feeding white bread to ducks. I fancy bran bread crumbs would be quite as good, or cracked wheat bread, and I should not hesitate to try corn bread crumbled fine. The third day after hatching, mix bran with considerable clean sand and make it crumbly wet. Feed on a board four or five times a day. Give water in chick fountains and remove after each meal. If ducklings get wet at this tender age the wetting is often fatal. The water given should not be very cold, neither need it be warmed. Ordinary tap water is warm enough.

The tenth day a little corn meal and cut up alfalfa or other green stuff is added to the sand and bran and the proportion of this, is gradually increased till at the end of the fourth week the ducklings are on a mash consisting of equal parts corn meal and bran, with 15 to 20 per cent of green stuff added. Many breeders add beef scrap after the first two weeks, but the ducks seem to do equally well without animal food. Perhaps they would grow more rapidly with it, but in war time, when beef scrap is expensive and likely to be scarce and scarcer, it is as well to do without it when it can be dispensed with. If green stuff is kept before

that the mash is mostly bran, with a very little corn meal added. If they have green range, no greens need be used in the mash. Some breeders feed cracked corn and even larger grains, but this is expensive feeding, and the ducks do better without it.

The goose has been called the most intelligent of all farm poultry. Certainly the goslings are very friendly. They are accused of being domineering after they reach maturity, but the young stock are companionable and docile. No other poultry can equal them in growth. My Emdens last year weighed ten and 12 pounds at three months of age. That is twice as large as a duck and four times as large as an ordinary chicken. If they brought as high a price as chickens or even ducks they would be the most profitable of all poultry. Unfortunately there is little demand for them except at Christmas and certain Jewish holidays, so any attempt at intensive culture is out of the question. On the farm where their feed costs but little a fine roast goose for the occasional holiday is decidedly worth raising. On the continent they are raised for their feathers, but Americans do not care much about picking live geese. The feathers are very valuable if one does not mind

taking a little more trouble for them.

Goose eggs require from 28 to 30 days for incubation. The eggs may be hatched either by hens or by incubators. If they are hatched by hens a close watch must be kept after the eggs pip, for the hen does not always like the looks of this queer foster child. Toward the end of the laying season the goose should be allowed to hatch a brood.

Goslings that are artificially brooded should be kept quite warm the first two weeks. A jar of hot water wrapped in flannel in their brooder box will give all the heat necessary, and they quickly outgrow the need of it. They can be out in the sun almost from the first day. If they have a good grass run, so much the better. But get them in before the afternoon becomes chill. They are not as susceptible to chilling as chicks, but are more susceptible than ducklings.

For 36 hours after hatching goslings need no food. Keep them warm and quiet and dry. Bread and milk may be given for the first day's feed. After this give them a moist mash three times a day. After they are on range they need very little mash. The mash may consist of bran and corn meal or of bran alone. A little sand and cut-up greens should be added if the goslings are confined but are not necessary if they are allowed to run. After the goslings are two or three months old they need but little shelter. An open coop or shed is sufficient.

Goslings are hardier even than ducks. If only they are kept warm and dry the first two or three weeks, they are thereafter immune to disease, untroubled by vermin, and quite able in most respects to look after themselves. Geese are herbivorous, and if they have good pasture need grain only during the breeding season. Add to this the fact that they are good breeders for ten years and live to a good old age, and you have a bundle of recommendations for the best farm fowl on earth.

Neither geese nor ducks require water to swim in, but both do better and are more economically fed if they have access to damp land and the vegetation which is peculiar to it. This is their natural food and the bugs and insects that are found among water plants supply the need of ducks especially for some animal food. When there is no pond or stream near by, ducks should be supplied with a pail or tub of water in which they can wash their heads. If they have no opportunity for washing the heads are apt to become infested with vermin.

## ADVISES AGAINST BUYING FOR CHRISTMAS GIFTS

The council of national defense issues the following statement:

The council of national defense and advisory commission have received inquiries as to the attitude of the government toward Christmas buying. Manufacturers and merchants are desirous to be advised at this time in order intelligently to plan for their Christmas stocks. Therefore the council and advisory commission now announce that it is their belief that Christmas giving which involves the purchase of gifts should be discouraged as relieving to that extent the present heavy burden placed upon labor, transportation, and other resources of the nation, and also as being in harmony with the previous announcement of the council and advisory commission urging thrift and economy upon the country.

Reflections

A side line which may be made a profit bringer on some ranches.

QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks Save The Farmer's Time

Time is the farmer's most valuable asset, in these days of intensive food production. Nash trucks save the farmer's time by hauling his loads to and from town in half the hours required by horse-drawn vehicles.

They let him leave home later and get back earlier. They enable him to put in more time at home in the fields where his time counts to most advantage.

Nash trucks are particularly suited to the farmer's needs because they are equipped with M. & S. automatic locking differentials. The driving wheels of Nash trucks cannot spin. This saves tires and saves fuel. It allows Nash trucks to get through where other trucks without this important feature cannot go.

The strong, internal gear drive rear axle of Nash trucks is not only simpler and lighter than others, but delivers more power to the driving wheels, especially at low engine speeds.

Our transportation expert will be glad to tell you more in detail of the many other superior mechanical features of Nash construction.

## Citrus Canker in Australia

The various states of Australia propose to make a fight on citrus canker which is reported to exist in the Northern Territory. The April issue of the Fruit World of Australasia says:

"A flutter was caused by a misapprehension which got abroad through a statement made by the minister of agriculture (Mr. Grahame). The misapprehension evidently arose from the report of a question asked in the assembly as to whether Mr. Grahame's attention had been drawn to the presence of the citrus canker in Australia. Mr. Grahame replied: 'My attention has been drawn to this disease, and the necessary action is now being taken,' but by no means inferring

that citrus canker existed in New South Wales.

"In September, 1916, the commonwealth government notified by proclamation that citrus canker existed in the Northern Territory; since then the New South Wales department of agriculture has taken every precaution to prevent the entry of the disease into New South Wales, and the rigid restrictions imposed will not be relaxed. The minister has caused a further communication to be addressed to the commonwealth government regarding the representation put forward by the fruit growers association for steps to be taken to stamp out the disease before it has an opportunity to spread from the territory."

## Citrus Fumigation Described

No other gas is so effective in quickly destroying insect pests as hydrocyanic-acid gas, says the United States department of agriculture's Farmers' Bulletin 923, Fumigation of Citrus Trees, by R. S. Woglum, which also pronounces the fumigation of plants with the gas to be one of the most important discoveries in the field of insect control.

The success and rapid development of the gas treatment in California, the bulletin says, not only resulted in the almost complete abandonment of spraying as a means of controlling citrus-scale insects, but led to the introduction of fumigation into other citrus regions of America as well as into most important producing foreign countries.

Directions given in the bulletin are specifically for the control of scale and related insects infesting citrus trees, but with proper modifications they apply to the control of similar insects on other trees and plants. The bulletin deals with methods of procedure, necessary equipment, chemicals of fumigation, and effects of the gas on insects and plants, and includes dosage schedules to be employed for the control of the various common citrus pests.

### Why Fumigate Only at Night?

Fumigation should be carried on only at night because the actinic rays

of light intensify plant injury, both during and immediately after fumigation. Plants fumigated in direct sunshine or placed in direct sunshine within one or two hours after treatment usually are injured, the degree of injury depending upon the strength of gas used and the temperature of the air. Plants fumigated in diffused light appear to be no more injured than those fumigated in darkness.

Trees of the first row fumigated at night and those of the last row fumigated in the morning frequently are more or less injured. In the former case, injury resulted from operations being begun before sunset; in the latter, from work being continued after sunrise.

### Guard Against Injury

Since a much greater strength of gas is required for some insects than for others, and because different plants vary widely in their power to withstand the poison, it is necessary to consider carefully the plants to be fumigated. The foliage and branches of orange, lemon and grapefruit trees will stand without severe injury a strength of gas sufficient to destroy most of the scale insects which affect them. Apple, peach, pear and other deciduous trees in dormant condition can be fumigated without injury with a strength of gas greater than it would be advisable to use on citrus fruit trees.

## Potash After the War

There is little doubt that Germany has long regarded the possession of the Stassfurt potash deposits as one of its most valuable pieces on the diplomatic chess-board, says the May edition of the World's Work.

It has hoped to recoup a large part of its war costs by making the rest of the world pay through the nose for potash after the war, and to utilize what it has regarded as control of the world's fertility as a club to compel concessions whenever peace conferences convene. Two elements that Germany did not foresee have arisen to block this game. One will result from the restoration of Alsace to France. It has been disclosed only recently that the potash deposits discovered in that province in 1909 are even larger and more accessible than those of Stassfurt. The other is the development in America of methods of potash production that will be on the one hand adequate to supply the growing needs of American agriculture and eventually provide a surplus for export and, on the other hand be capable of withstanding any future

German attempt to destroy the industry by "dumping," without the aid of government subsidies or the shelter of a tariff wall. Alsace is in German hands, but when it shall have been restored to France its potash resources will not only break the German monopoly but provide France with a valuable export commodity to exchange for the vast supplies of all kinds she must obtain from us.

### RATING THE TRACTOR

Continued from Page 771

heralded and the reputation for delivering the goods with a safe margin is all that is necessary to establish a stable, permanent trade.

"A month or so ago a large tractor school was held in Columbus, Ohio, under the auspices of the Ohio state university. Some 20 or more different tractors were brought to the school by manufacturers to enable the farmers to study the different types of machines. As a part of the course brake tests were conducted by the students, but only on tractors voluntarily offered by the manufacturers for the

test. Nearly one-third of the machines were unable to attain their belt power ratings in the first tests instead of having some 20 per cent surplus power.

"In certain cases we understand that it was necessary to operate machines sold as kerosene burners on gasoline to obtain their belt power rating, and in others the motors had to be speeded above normal.

"Nothing but trouble is in store for the tractor manufacturer who advertises a rating which is the maximum possible under ideal conditions, for those conditions will hardly be approximated in the hands of the farmer.

"Until manufacturers generally adopt the S. A. E. standard ratings, the best way for dealers to judge the 'margin of safety' is to figure the cylinder displacement per minute per plow. To obtain this, square the bore in inches, multiply by the stroke in inches, then by the number of cylinders and finally by the r. p. m. Divide this result by the number of plow bottoms recommended. Conservative manufacturers are increasing their displacement per minute per plow each year. Not many seasons ago the displacement was around 75,000 per plow, whereas now it is nearer 100,000 or more."

Where it is possible to keep the tractor going day and night it should be done, for interest on the general "overhead" is no greater in a 24 hour service than in eight. What is more, the times are demanding very ounce of production possible, so we are glad to touch in the answers to queries this week on the point of lighting system for operation on tractor. Systems may be installed which are effective, costing from \$50 to \$200.

#### TRACTOR QUESTIONS

##### Electric Light for Tractor

Is there a satisfactory lighting system which one may attach to tractor which will make night work practicable? How much does such system cost, and is its operation expensive?—Subscriber, Fresno.

There are several satisfactory light plants to be used on tractors for plowing at night. You can get a generator, drive it from the flywheel of your tractor or from the belt which is controlled by the governor on the end of the generator shaft, allowing the generator to run at the maximum speed to handle your lights. We would suggest using a six inch spot light as used on an automobile, setting them on the fender of your tractor, using one forward and one rear for your plow. You can also equip your tractor with a storage battery and generator, which will be very expensive. This system would cost you something like \$150 and would not be very satisfactory as the dust and jar of your machine would be too hard on your storage battery. We would suggest your using the former outfit which would cost you not to exceed \$50.

##### Tractor Repairs

I have not yet dared to own a tractor. The investment is large and the repairs are an uncertainty. How serious a proposition is this matter of upkeep? My auto experience has taught me that with tires, gas and a few other things the expense is heavy, but more efficient service and greater accomplishment compensate, but tractor "service" has not yet reached the standard of auto "service." Are the manufacturers and dealers preparing to take care of our machines if we buy?—Subscriber, San Diego.

A great many of the successful tractor builders are running schools teaching the purchaser or prospect how to

take care of their bearings and oiling devices, and how to adjust them. There are a great many schools over the country that teach this at nominal

price. Various high schools in California are contemplating tractor courses another year. San Fernando High conducted a tractor course last spring.

## Keep Irrigation Water Away From Drain Lines

Many drainage systems are injured by the irrigator in careless application of water upon the fields where these drain systems have been installed.

The ordinary procedure is to backfill his trench, plow the field, run his leveler over the same, sow his seed and irrigate in the ordinary way.

When this is done the loose soil in the trenches that were opened in order to lay the tile for the drain system is sure to settle and the water following along the trench finds its way downward and into the tile, in many cases washing wagon-loads of dirt into the line, and very often completely plugging it.

This can be avoided very easily by leaving the dirt crowned over the trenches, when the backfilling is done, and then plowing a furrow or two on each side of the trench, crowding the dirt inward as much as possible with a "V." This makes a considerable ridge in the field with a ditch on each side of it, and the irrigation water entering this ditch will flow down the

same and never reach the drain line itself.

If it is necessary to carry the ditch across the drain line, this should always be done by fluming across it. Irrigate the field in this way for two or three years, until the soil in the trenches has become thoroughly settled, then the field may be plowed and crops grown directly over the drain, irrigation water applied in the usual way and no damage will be done.

If every farmer who has a drain on his farm would read the above and remember it, much money and much hard work would be avoided during the next ten years. — E. B. House, Colorado Agricultural College.

Santa Cruz County has a new horticultural commissioner. Donald D. Penny has been appointed to the office. He succeeds W. H. Volck who resigned sometime ago.

Jute wasteballs can now be secured from San Quentin at \$2.50 per thousand. There has been a serious shortage in supply.

#### FERTILIZER AVAILABLE AT CANTONMENTS

In the next few weeks contracts will be made by the office of the quartermaster general of the army for the sale of manure accumulating at all the national army cantonments, national guard camps, remount depots, and other important government posts. It is anticipated that these contracts will cover, in the aggregate, approximately 3,000,000 tons.

According to the latest published reports of the United States department of agriculture, there was used, in 1916, the third year of the war, nearly 2,000,000 tons less of commercial fertilizer than was used in 1914, the first year of the war. This was due to the limited available supplies of commercial fertilizer and consequent high prices it commanded even where it was obtainable.

The opportunity to purchase this manure from the great camps and remount depots of the country should prove a great boon to the agricultural interests of the United States.

At planting time remember the likes and dislikes of your family, and then, when canning time comes, you will not have more tomatoes than you can possibly use; and next winter your family can enjoy green beans, canned corn, spinach, sweet peppers, with all sorts of pickled relishes.

## A New Theory as to Soil

From an Address by Prof. C. B. Lipman before Society for Promotion of Agricultural Science.

OW does modern theory in soil chemistry differ from the old theory? Let us take a specific example to illustrate and emphasize the point. A decade ago there were scarcely a handful of soil chemists who would have had the temerity to propose that we discontinue the use of the strong acid digestion method in soil analysis. The theory upon which that method was based was that it was equal to the task of indicating the portion of soil minerals which become available to crops in soils, with a fair degree of facility. This assumption was based on another assumption, to the effect that there exists in the soil, as we know them to exist in certain mineral deposits, compounds known as zeolites, which delivered up to solvents of no great power the bases held by them in considerable quantities. Moreover, the method of strong acid digestion of soil was based on an alleged correlation between the results of analyses made by it and the crops produced on the corresponding soils. We know now that the zeolitic theory and the alleged uniform correlations just mentioned are, to the scientific mind of today, wholly untenable. The facts and objections which are used in support of such assumptions and correlations may be explained very easily in other ways. Today, therefore, as contrasted with a decade ago, there are but few soil chemists who can see any value, practical or scientific, in the maintenance of a strong acid digestion method for soil analysis and as a means of indicating the crop producing power of soils.

In other words, the modern soil chemist can no longer see the cogency of methods which are wholly established on assumptions of questionable value. He cannot, in the light of modern chemistry, discern the utility, for none seems to him to exist, of the determination of a certain portion, arbitrarily delimited, of the total mineral constituents in soils. On the other hand, the methods of water extraction of soils, which a decade ago were considered by most soil chemists as wholly questionable in value to soil chemistry and soil fertility studies, are now, in conjunction with the most modern studies on the soil solution, coming to assume a position of great importance in our work. Their use may be said to be very wide, if not general, and the laws of mass action and chemical equilibrium are always had in view when applications of these methods are made. Unfortunately, the soil solution is so complex a medium as to make impossible, as yet, any quantitative application of the laws just mentioned. Nevertheless, it does make possible the explanation of much that in recent years has seemed very mysterious, and, in a qualitative way, is casting much light upon hitherto very much vexed problems.

As another example of the striking metamorphosis through which soil chemistry has passed within the last few years, we may take the soil acidity question. Not more than five years ago, soil chemists almost without exception believed in one of two theories on the origin of acidity of soils. The first was the very old theory that acidity was produced through the formation in the soil of organic acids of a large variety by the decomposition of organic matter therein. The other

theory, which was a relatively new one, consisted in the idea that soil acidity was produced by a lack of bases to satisfy so-called unsaturated silicates with the necessary base, or with the base necessary for full saturation, and hence blue litmus paper applied to soils containing such silicates must turn red without necessarily indicating the existence of free acidity. In the last five years, we have learned to consider both of these views and to evaluate them properly. We have now in hand indisputable evidence that soil acidity means nothing more nor less than an actual excess of hydrogen over hydroxylion. The distinction which even the most modern authors of textbooks on soils insist on drawing between positive and negative acidity seems to be both futile and sterile. Viewed either from the scientific or practical standpoint, soil acidity must be regarded as a condition produced by an excess of acid over base. Whether we have free acidity in the form of sulphuric acid, or oxalic acid, or carbonic acid, or some other free acid, or whether we have acid salts like the acid silicates, to which reference is made above, an excess of hydrogen ion exists in the soil solution and gives all the reactions in the laboratory and all the effects in the field which the reddening of blue litmus paper as a qualitative test indicates.

When summed up, the following points come clearly before us:

The total content of the soil in minerals containing the elements which are essential to plants gives little or no indication as to the value of a given soil for crop production.

We can no longer regard an element or compound as being available to plant roots merely because it is dissolved in the soil solution.

The reactions caused by salts in the soil solution are of equal moment with those which may be induced therein through the solvent powers of acids. Indeed, we recognize no fundamental difference between the two.

The available plant food elements in the soil solution must be measured by some method which accords more closely with the natural conditions under which plant food elements are rendered available in the soil solution than any method heretofore employed does.

Application of the laws of mass action and of chemical equilibrium in the soil solution makes it possible for us to conceive for the first time, with some measure of clearness, the laws regulating the solution of various phosphates in the soil, as well as of many other substances which are of vital importance to the plant.

The total concentration of the medium of growth, as has been recently demonstrated, is one of the important factors to consider in connection with the soil solution in our crop producing soils.

In addition, the proper balance between the nutrient elements or between the salts in a medium in general, has been clearly demonstrated to be of the highest importance in a proper comprehension of the problem of the growth of plants in solution.

These conceptions make possible a much more rational approach to the study of the alkali problem in soils and clarify much in this problem which heretofore has been extremely puzzling.

Colloids of the soil as a factor in regulating the concentration of the soil solution, both by natural and artificial means, have come to be properly appreciated only within the last five or six years.

The nature of soil acidity and the methods for its determination, as above outlined, form a part of the new contributions of modern soil chemistry.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## PEAR PRICES

The California Pear Growers' Association announces today the fixing of a price for Bartlett pears for canning purposes for this season. The price set is \$70 a ton for what is known as No. 1 pears of high quality, but at this price certain deductions will be made to canners for freight charges to nearest canneries, making the f. o. b. price at growers shipping point from \$1.50 to \$4.00, or upward, less than the \$70 a ton. Contra Costa pears, for instance, would bring the grower about \$68.50 per ton, and pears from districts more remote from the nearest cannery would bring less. A No. 1 pear is at least two and one-quarter inches in diameter, and is one that is free from scale, worms or pear-scab. A very high grade of pear is used for canning.

The price determined upon is the result of a careful investigation of the cost of growing. Years ago growers could sell pears at \$35 a ton and make a profit, but these were the days when farm labor could be obtained at from \$1.00 to \$1.50 a day, without board. In these days of labor shortage, from \$3.00 to \$4.00 is being paid. In recent years continuous and skilful work is necessary to preserve a pear orchard from disease. Between the years 1900 and 1910 half the pear orchards of California perished or were dug out on account of disease, at a loss to growers of millions of dollars. At the present time, frequently as high as \$75 an acre is paid for spray materials alone, besides the cost of applying the spray, which sometimes adds \$35 an acre, making a cost for merely spraying the orchard six or seven times over \$100 an acre. Expensive tractors are supplanting the old fashioned horse. Motor trucks haul the pears to the railroad. In 1916, when labor and material expense were still low canneries paid \$50 to \$52 a ton. The price this year represents an advance of about 36 per cent.

Last year nearly 4800 carloads of fresh pears were shipped East, many growers netting from a minimum of \$60 a ton to a maximum of \$83 a ton, the latter figure being realized by Frank T. Swett, president of the Pear Growers' Association.

This season the crop, according to careful estimates by the state horticultural commission, is at least 10,000 to 12,000 tons short of last season. While there is a strong tendency among growers to ship the bulk of their pears East as prices bid fair to even exceed considerably last year's prices, the Pear Growers' Association is calling on members to deliver 20 per cent at least of their tonnage for cannery purposes, as the association desires to see the canning of pears maintained as nearly normal as possible.

Were it not for the association, it is probable that the great bulk of all pears would move to Eastern markets, leaving very few for the canners. The association, however, believes that the ultimate good of the pear industry is dependent on keeping the pear, in all its forms, fresh, canned and dried, before the consumer. The acreage of pears in California is rapidly increasing, and possibly ten years from now, if the orchards can be maintained against the attacks of pear blight and thrips, instead of 80,000 tons of pears, there will be produced 250,000 tons of pears annually, making pear production one of the really big industries of California.

## ARGENTINE ANT GIVES AID AND COMFORT TO ORANGE ENEMIES

The chief importance of the Argentine ant in orange groves is due to the fact that certain injurious scale insects become much more abundant as the result of its presence and that it fosters mealy bugs and aphids, according to Farmers' Bulletin 928, "Control of the Argentine Ant in Orange Groves," by J. R. Horton, published by the United States department of agriculture. This ant is very

fond of the sweet substance known as honeydew excreted by mealy bugs and other soft scales and is always very attentive to them and prevents many of their insect enemies from approaching them. Thus the natural enemies of these pests are hindered in carrying on their good work, and as a result some of the soft scales become excessively abundant.

The armored scales, of which there are several that feed upon orange trees, are not protected by the ant; but in patrolling the trees constantly in large numbers in search of insect prey the ant hinders, to a certain extent, the work of the natural enemies of this class of scales. The ants also eat all insects that they can capture except those supplying honeydew, and therefore they disturb certain enemies of the armored scales and perhaps occasionally feed on the eggs of some of them.

## Control Measures

In Louisiana, where the Argentine

ant was introduced a quarter of a century ago, the preventive measures are: A general improvement in orchard cultural practices, including the control of such orchard pests as the armored scales, the white fly, and the rust mite; direct measures for the destruction of the ant colonies by the use of traps. By far the best and most practical means of destroying the ant in Louisiana is by trapping. It is the only method adapted to ant destruction in large groves and can be used equally well with a few trees. The trapping method is based on the fact that the ants can be induced to concentrate in artificial nests to avoid rain, and can there be conveniently killed by fumigation. The successful orange growers find that a number of small traps, usually 25 per 100 trees, is preferred to a smaller number of large ones. In order to induce more rapid concentration of the ant colonies

in the traps, the orchard as far as possible should be kept free from suitable natural nesting places such as loose boards, piles of branches or weeds or any other rubbish.

## Use of Poisoned Baits

In some cases poisoned syrups and other baits have proved successful in controlling the ants. When this method is used it is desirable that all sources of food other than the poisoned bait be eliminated so far as possible.

In Louisiana orange groves the extensive use of adhesive and other repellent mixtures for banding tree trunks to keep out ants is not recommended in view of the more positive method of destroying them by trapping; but in the citrus fruit sections of California this method is more generally and successfully employed, and the ants are reduced in numbers by the use of poisoned syrups. In California the armored scales are controlled by standardized methods of fumigation, and regular cultivation is more generally practiced than in Louisiana.

# Yuba success turns on the ball

THE ENDLESS TRACK runs on two sets of enlarged ball bearings, with friction reduced to a minimum. The weight of the machine and the wear of its motion are borne by the steel balls. They run in a cast-steel ball race, over the manganese tread links lying on the ground. There's no slack chain to pull, the power generated by the engine is centered at the draw-bar.

The large steel balls used in the Yuba Ball Tread Tractor are the "good roads" of tractordom.

The steel balls are 2 1/4 inches in diameter, each being capable of carrying 90,000 pounds without damage.

Friction is reduced to a minimum by the use of high duty roller bearings, cut gears

of high-grade steel having a special tooth shape, to aid in reducing the loss of power still further.

Please tell us the number of acres you have, and the kind of operations.

In the 20-35 the bearing area of treads is 1,680 square inches. The pressure on the ground due to the weight of the tractor is less than five pounds to the square inch.

The width of the tread is 17 1/2 inches; speed at low gear is 2.06 miles; at high gear, 3.28 miles an hour. The draw-bar rating is 20 H. P.; the maximum sustained pull is 5,000 pounds. The power as a stationary plant is 35 H. P. The total weight is 10,250 pounds. Carries 38 gallons distillate and 7 gallons gasoline.

*The sum of all these things means for you a better farming implement, deeper plowing, more thorough cultivation, at the right time, at less cost.*

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## Tanning Rabbit Hides

I would like to know how to prepare rabbit hides for market. Some that I have cured have lost the hair. What is the best way to do it?—Subscriber, Spring Valley.

When skins are ready wash them in solution of one-half tub luke warm water to which has been added one-half bar of common laundry soap, one pound of sal soda, one-quarter pound of concentrated lye and one ounce of liquid ammonia. This removes the glue from the pelt. Then mix in five gallons of water three and one-half tablespoons of common salt. When salt is dissolved in the water stir in two ounces of sulphuric acid

(liquid). Do not inhale fumes of acid when mixing. Mix this in wooden tub. Put hides in brine and let them stay covered with the brine from six to 20 days. To tell when to remove, stretch skin over knuckles, and if white like rawhide take out; if not let them stay in longer. When tanned take out, wring out and hang on line till nearly dry, then pull and stretch over edge of hardwood board in all directions. Do not let them dry too fast. Do part of this each day, rolling up skin between times. Wash hide in gasoline to clean, rubbing well with starch, then dry fur with corn starch or Fullers earth. Shake out starch or earth when dry, and then skin is ready to use. If work has been properly done results will be satisfactory.—W. D. W.

## Breeding Rabbits

Will you please tell me what is wrong with my rabbits. The buck serves them but they don't bring any young.—Subscriber, Laverne.

Take doe to buck's hutch. Let buck serve doe twice. Test him with several different does. If no results get rid of him. A good fat buck often makes a good roast. See our issue of April 27, page 545 for similar instructions under heading "Barrenness in Rabbits."—W. D. W.

## Fruit Thieves

I note in news notes that Fullerton and other Orange County sections are to deal with those who are stealing their oranges in a way to prevent these depredations. Please tell us how best to deal with this question. Porterville growers suffer greatly, and our loss during the past year has been very pronounced.—Subscriber, Tulare County.

The only method which will prove satisfactory is that tried in Pomona a few years ago. Watchmen were deputized to patrol certain sections where the thievery had been prevalent, and arrests were made and severe fines imposed. Any community which has a justice of the peace who will do his duty may soon control this evil. If, however, amongst the first who are caught in the net are some youngsters of the "first families of the state," and a floater is imposed, then the evil will only be encouraged.

## Die Back

I am sending branches from the tips of my orange trees. Orchard has been well cultivated and irrigated, yet the tips are continuing to die back.—Subscriber, Bakersfield.

This die back, or dying back of the tips, is generally considered to be something like chlorosis, or yellowing of the leaves of an orange tree. That is, it is a general indication of disease or of a physical condition which may come from several causes. There is a disease known as citrus blast which

was fully described in the Cultivator of March 30, 1918, page 388. That disease makes the tree somewhat resemble those from which these branches were taken, but we do not think this disease is in Kern County. The only suggestions for treatment are most general. In the first place, look to the soil. Is it light and loose so as to allow air access to the roots? If not, lightening up with coarse strawy manure and lime may prove beneficial. On the other hand, perhaps drainage is necessary. Irrigate so that the very lowest depth to which the roots go is reached by the water. In other words, put the soil and tree in best of physical condition.

## Poisoning Squirrels

How can I get rid of squirrels at this time of year? I have tried many methods but none have been satisfactory.—Subscriber, Long Beach.

It is possible that the ground is a little dry to secure best results with carbon bisulphide, kilmol or other gas treatment, still thousands may be killed if the holes are well filled and packed. With all feed drying up excellent results may be had by the use of poisoned watermelon rind or juicy fruits. A bit of strychnine inserted with point of knife in watermelon rind and fruits does the trick. The poisoned grain formula, which was given in the Cultivator of January 26, page 109, is good at all times.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

## Storm Water

The storm water and irrigating water from several orange groves in this vicinity, according to the slope of the land, may be run into a main wash which is the natural water course, but for five or six years it has been diverted and has run across groves lower down. These lower growers object, claiming that the water should be run only in the wash. Is this objection good?—Subscriber, Covina.

The owner of a lower tract cannot object to the passage of surface water from a higher tract, which has become accustomed by natural flow to pass over his land, but this does not apply to surface water turned on the lower owners by artificial changes made by those owning land above them. Where water by such artificial changes is made to flow upon the lands of another which would not naturally flow thereon it is an injury to his right of property and a nuisance per se, the continuance of which he has a right to have enjoined.

## Trespassing Stock

Where trespassing stock is causing an injury, and it is desirable to impound such stock to prevent further damage, how may one proceed so as to be protected from loss in the costs of feeding? If notice is to be given, what is the legal form? Should it be recorded? If owner is unknown then how is notice given?—Subscriber, Los Angeles.

The person taking up an estray animal shall confine it in a secure place and within five days file with the county recorder of the county in which the estray is found a notice containing a description of the animal, with the marks and brands, if any, stating the probable value of each animal, place where the taker-up found the animal, and where it is confined; date the notice and sign his name. The county recorder is entitled to a fee

of 50 cents for recording the notice. If the value of the animal or animals together exceeds \$10, the notice must also be published in a paper of general circulation in the county at least once a week for three successive weeks, stating the time when the animal or animals will be delivered to the constable. Or, if the finder knows the owner or keeper of the animals, then within five days after the animal is taken up he shall notify such owner or keeper of the animal, which notice shall contain the same information as that heretofore described; in such instance it is, not necessary to record, but the finder is entitled to his fee of 50 cents for serving the notice personally upon such owner or keeper.

At any time within 30 days from the date of filing the notice or the service thereof, as the case may be, any person demanding possession of the animal may appear and pay the taker-up all damages, expenses and costs, and upon receiving such payment the taker-up shall immediately deliver to the person claiming the animals the possession thereof. Such payment is made up of the following items:

The recorder's fees: Fees for publication of notice, attorney's fee for preparing the notice not to exceed \$2.50; 50 cents per day for the keeping of each horse, mule, jenny, ass, cow, bull, ox, steer, or calf; 15 cents per day for every other animal; if the taker-up fails to properly feed and water the animals while in his care, he loses his right of lien.

If the claimant is dissatisfied with the fees claimed, he must tender the amount he is willing to pay and within ten days bring suit in the proper court for possession, where he must establish his right to possession; in case the amount tendered was correct and plaintiff is entitled to his costs of action from the taker-up, possession shall not be delivered until the amount adjudged due is paid to the taker-up; in case the taker-up is successful he is entitled to his costs.

If no one appears and pays or tenders the expenses of the taker-up within the 30 days after recording of notice, or fails to commence the action before mentioned, the taker-up shall notify the constable of the township, or sheriff of the county where the animals are held, which notice shall specify that he has complied with the provisions of the "Act relating to estrays, etc." that no claimant has appeared, or, if he has appeared, that he has failed to pay the expenses and costs and has failed to commence the action, or that the action has been dismissed, and that the animals are held subject to sale. The constable shall immediately proceed to sell the animals at public sale as he sells personal property upon execution. Out of the money realized the officer first retains his fees, then pays the taker-up his expenses and costs to date, and the surplus, if any, into the county treasury. Such sale conveys good and perfect title to the purchaser. If the taker-up uses reasonable care of the animals he is not liable for the death or injury of any while in his possession.

## Bee Keeping Law

I have understood that according to the state law bees cannot be kept within three miles of another man's apiary, even though upon the keeper's own property. Is this correct?—Subscriber H. E. S.

The only law concerning bees and their keeping is contained in an act concerning "foul-brood." This act provides that upon petition to the board of supervisors by ten or more

## Gardner's Bean Harvester

meets the requirements of the rancher and is within easy reach of all.

resident, property owning, apiary keepers, the board may appoint a skilled bee keeper as county inspector. Such inspector may inspect every apiary in the county and wherever he finds any infected with foul-brood or other contagious or infectious diseases may order them destroyed as a nuisance. The inspector may also, in his discretion, order the owner or person in charge of bees infected with foul-brood, or any person within a radius of three miles of such infected brood, to transfer their bees, and in default of such transfer may order the bees, combs and hives destroyed. A law applicable only to San Bernardino County provides that any owner of 20 hives of bees is entitled to sue for and recover from the owner of any hive of bees which is infected with a contagious disease, who after ten days' notice fails to apply a remedy therefor, the sum of \$2.50 for each hive so diseased.

ANOTHER LIVE STOCK SHOW

The California International Live-stock Corporation has established headquarters on the ground floor of the Merchants Exchange Building, San Francisco, and is busy preparing for their first annual exhibition to be held in San Francisco, November 2 to 10 next.

An executive board has been appointed as follows: W. T. Sesnon, chairman; Edgar J. De Pue, M. H. Esberg, R. B. Hale, C. K. McIntosh, Vanderlynn Stow and F. L. Washburn, while Joseph E. Painter, well known live stock man, is manager of the corporation.

A preliminary classification and premium list is now being compiled, the classification committee consisting of L. F. Washburn, chairman; L. A. Nares, A. W. Foster, H. H. Gable, C. B. Cunningham, James Henderson, Dean H. E. Van Norman, H. A. Jastro, M. H. Tichenor and Jose E. Painter.

About \$30,000 in premiums will be awarded, and the national breed associations have offered through their secretaries special prizes for the various breeds. Communications have been received from many of the live stock associations, expressing their willingness to assist in every way possible. From present indications the show to be held this fall will be a huge success and the forerunner of future annual events.

Letters of inquiry are already being received from exhibitors in states as far east as Kansas, and there seems little reason to doubt, when the entries are finally made, that every available foot of space will be occupied.

NAIL IT ON THE SHOP DOOR

It too frequently happens that in going to the hardware store to purchase nails we find ourselves in doubt as to what size we want. Nails are usually sold by the pound and according to the "penny." For example, a 10d nail is 3 inches long and .15 of an inch in diameter. The following table gives information on the different common nails. Remember that brands differ from common nails only in the head and point.

Size	Length in Inches	Diam. in Inches	Nearest B. & S. Gauge	No. to the Pound
2 d	1	.07	13	876
3 d	1 1/4	.08	12	568
4 d	1 1/2	.10	10	316
5 d	1 3/4	.10	10	271
6 d	2	.11	9	181
7 d	2 1/4	.11	9	161
8 d	2 1/2	.13	8	106
9 d	2 3/4	.13	8	96
10 d	3	.15	7	60
12 d	3 1/4	.15	7	63
16 d	3 1/2	.1	6	49
20 d	4	.16	6	31
30 d	4 1/2	.21	4	24
40 d	5	.23	3	18
50 d	5 1/2	.24	2	14
60 d	6	.26	2	11

Frank P. Goeder, Colorado Agricultural College, Fort Collins, Colorado.

BEE NOTES

The amount of honey required to make up the "minimum" car under new traffic regulations is 450 cases, which is about 30 tons.

Less than half of the bee keepers of California have signed up with the cooperative marketing association, the California Bee Keepers' Exchange. This is to be regretted, for the only way of securing full return from any product is for its producers to be in a position to command rather than simply to accept the offers of the well organized buyers.

Mr. Mendleson of Ventura County reports the season has been so cool that queen rearing has been almost impossible.

California produced nearly 400 cars of orange blossom honey. It commanded 20 and 21 cents f. o. b. local shipping stations, record prices so far as California honey is concerned. Yellow beeswax is now commanding 41 to 43 cents.

SAVE THE HONEY

With present and future shortage of sugar both considered there is every encouragement to the honey producer to save every pound he can. Prices are entirely satisfactory, and the honey makers are finding this a most profitable year. California extracted honey is selling in England well up toward 50 cents per pound. It is rumored that the food administration may fix the California price around 16 or 18 cents, but with quick sales there is still opportunity of profit for the honey producer notwithstanding the fact that cost of production has increased nearly 100 per cent.

BOOSTING THE BEE BUSINESS

Production of honey will be greatly increased during 1918 in many localities, according to reports received from extension workers of the United States department of agriculture. The increase in Colorado this year will probably be 100 per cent, it is said. In many localities there has been a marked increase in winter protection, and the bees passed the cold season and were ready to begin work of gathering nectar as soon as the weather permitted.

NEW PEA

John C. Sullivan, a Napa County subscriber, sends a package of peas which should be exceptionally valuable for forage or for green manure crop. Mr. Sullivan says:

"On the driest ground these peas will produce an immense crop without irrigation. These peas stool out and when planted in rows 2 1/2 feet apart one way and 10 or 12 inches the other, three peas to a hill, will completely cover the ground. Frost does not injure them. I think they would make a fine cover crop."

A GOOD FAIR

A subscriber at Mesa Grande, San Diego County, writes regarding last year's Riverside fair and says: "This fair was so well managed last year that many from this county will attend this year." He thinks every live stock producer should exhibit at the fair for no other means affords opportunity for such information as a comparison of live stock which is possible at a county fair. Above all, the owners of pure bred should keep their live stock recorded.

Uncle Sam is today the quartermaster of a hungry world. He is playing the game squarely and counts on every American to do the same.

Alpha Gas Engine  
Superior Construction  
Unfaltering Power

IT PAYS to invest in ALPHA QUALITY—quality which provides ample reserve in every part for hard, continuous service. Power to stand up under abnormal strain. The Alpha meets with ease and certainty the grinding demands of every day service year in and year out—a constant source of gratification to their owners.

1 1/2 to 28 H.P.—IMMEDIATE DELIVERY

Viking Rotary Pumps

An Ideal Irrigation Pump

Viking Pumps will deliver more water per minute for the same amount of power used than any other type. Its very high efficiency is due to its positive delivery, its correct design and careful manufacture. It is SELF PRIMING, requiring no foot valve or priming pump and is easy to install. Investigate the Viking Pump. Built in all capacities from 20 to 1600 gallons per minute. Immediate delivery.

Wilmo Manifold

# FILL OR EMPTY YOUR GRAIN TANKS WITH THIS ELEVATOR

Let the John Deere Tubular Steel Elevator serve you when marketing your grain and when harvesting it. From the wagon it elevates into tanks, granaries, cars, etc., from the tanks it elevates into the wagon. Its two-fold use multiplies its value as a time and labor-saver.

## JOHN DEERE TUBULAR STEEL ELEVATOR

Handling your grain in bulk with a John Deere Elevator is not a temporary means of meeting the present shortage of sacks—it is permanent equipment that will continue to save you money for years to come.

### A Practical Outfit for Every Grain Grower

It elevates the biggest load of any kind of small grain in from 6 to 10 minutes—handles 15 to 20 bushels per minute.

Backing the load is never necessary. The hopper can be folded out of the way without even stopping the engine, when the load is driven up. The adjustable feed adapts elevator to power applied. Operated by either horses or engine—a 2½ H. P. or larger engine will run it.

Built of steel it cannot warp or decay—will last for years. Elevator proper made of ¾ in. steel well-casing, 6½ in. in diameter. Absolutely will not sag.

Portable outfit furnished for large ranches where quick transportation is required.

Let a John Deere Elevator pay for itself with the money it saves in time, labor and sacks. See your John Deere dealer. Act now. Shipments made from stocks at Portland, Spokane, Boise and San Francisco.

WRITE FOR FREE PACKAGE TE43.

## New Asparagus Strain Rout "Rust" Disease

Ten years of introducing, testing and hybridizing asparagus from all parts of the world by J. B. Norton, a plant breeder in the United States department of agriculture, has resulted in the development of a new strain of asparagus that is not only larger, more uniform, and more productive than the old varieties, but is highly disease-resistant, a virtue that American asparagus heretofore has lacked. Development of the new strain is expected eventually to stamp out the "rust," a destructive disease that swept over the country a few years ago, leaving the asparagus fields brown and dead and wiping out the profits of the growers. Commercial quantities of the new type in Washington, D. C., recently sold for more than double the price of other asparagus.

The new asparagus is "highly well born." Its parents were selected from many thousands, and were not only of outstanding quality, but possessed the power of transmitting their good qualities to their offspring. In asparagus there are male and female plants, the first producing only pollen, the latter seeds, when properly pollinated. Of all the thousands of plants grown, one male named Washington has proved superior. He has been mated to many seed plants, but the progeny of two stand out above the others. One named Martha Washington is the new kind mentioned in the

first paragraph; the other, Mary Washington, promises to excel her sister family.

The method of pedigree breeding for better asparagus is expected to mean further improvements in future years when the disease is forgotten. The asparagus rust, in fact, is passing away, and the government plant doctors point to this as one of the most encouraging features of the work, as it indicates a possibility of overcoming other plant diseases through the substitution of resistant for susceptible varieties.

### Hope to Rout Disease

In the beginning of the outbreak asparagus rust was harbored and spread from every susceptible plantation. These centers of infection diminished as the old beds were killed or plowed up and replaced by semi-resistant stock, until wherever the old susceptible kinds are entirely exterminated the disease no longer prevails to any extent. In some sections, however, this replacement is not complete. Old fields abandoned by growers or plants growing wild along the roadside act as centers of infection and spread rust to cultivated fields near by. Elimination of the most susceptible varieties is very important. If this is accomplished there is reason to hope that the complete substitution of the new varieties for the old will result in partial or entire disappearance of the disease.

## Cutworms

Vegetable growers are now able to secure direct aid from the department of agriculture for their gardens and truck farms. A special field agent has been located at 800 North Marguerita Avenue, Alhambra for some months and is at the command of the growers to investigate insect control problems. "Garden Cutworms," a circular giving illustrations, life habits and general information regarding these pests is now being mailed. Control measures recommended are here given:

### How to Control Cutworms

Cutworms are not at all difficult to control, and there are several methods by which this may be accomplished. The best, however, is the poisoned bait or poisoned bran mash. The following formula is for use in a small garden:

One-quarter pound white arsenic, one pint syrup or molasses, four to six quarts water, one peck dry bran.

Thoroughly mix the arsenic in a peck of dry bran. Stir into four to six quarts of water, a pint of cheap syrup or molasses. After this has been made up into a mash let it stand for several hours to allow the bran to take up the arsenic.

Other powdered arsenicals, such as arsenate of lead, may be substituted if double the amount is employed. Dry Paris green may be used at the same rate as the arsenic. Arsenic is preferable, however, because cheaper.

Scatter the mash thinly along the rows or about the bases of the plants to be protected as soon as the cutworms appear. It is better to make the application well toward evening, or at dusk, since the cutworms feed only at night or on dull, cloudy days, and the bait is more attractive when fresh. If the cutworms should reappear, repeat two or three times at short intervals.

A grasshopper bait substantially as above with the addition of chopped lemons or oranges has been recommended, and the addition of this fruit may increase the attractiveness to cutworms.

Caution—Keep children, live stock, and chickens away from the bait, as it is poisonous. With proper care there is no danger.

### Other Remedies

In the case of severe attack by cutworms on low-growing plants, such as parsley, a lead-arsenate spray applied as for other chewing insects, will answer nearly as well as the bait, especially where there is no time to prepare the latter and the outbreak is sudden and severe.

Clean cultural methods, crop rotation, deep fall plowing, and disking are valuable in preventing recurrences of cutworm attack.

Hand picking is also useful, and experienced growers frequently become so expert in detecting cutworms that they can easily remove them by hand. The principal method is to remove them by the fore finger. The operation frequently is all that is necessary for the control of cutworms on small areas.

### ARIZONA OVER TOP

So far as known Arizona has contributed more men and more money to the prosecution of the war than any other state in the Union, according to population.

Arizona has: sent all of her class one men to France or into training camps; subscribed 205 per cent of her quota in the third liberty loan and has more than doubled her quota in the second Red Cross war fund drive.

Measure your wheat savings by the Golden Rule.

## Milo

An Imperial Valley firm which wishes to encourage more general planting of milo sends to farmers a circular from which we take the following cultural instructions:

"Make your crop before you plant it," is an old saying which holds good in the case of these crops, especially when there is danger of water shortage during July and August.

Irrigate your land, then plow it. Irrigate again, then disk it.

Irrigate again, then harrow, float and plant it, and your corn will grow to head without any more attention on most land, or without any subsequent irrigation during July and August.

-You get the benefit of all the irrigation you put upon the land by capillary attraction through keeping the surface fine and compact by your last operation before planting.

Plant feterita in double rows or 24

inches apart, and dwarf milo 30 inches apart, using about five pounds to the acre.

Some claim better results from two pounds of seed to the acre and rows four feet apart, as the heads grow larger and gathering is consequently easier. However, for a maximum yield, it must be "crowded just a little."

## A Pig 'n Chicken Ranch

Written for California Cultivator By Jean A. Koethen

SO MANY chicken ranch failures have come in past years from the erroneous idea that poultry keeping is not a profession but a job to which any down-and-outer may turn as a last resort that it is always a pleasure to find a lad who deliberately sets himself to work to learn the business, not as a last resort but as a deliberate first choice. We have an increasing number of such boys today, and one of them is Gale Poulton of Gardena, a boy who at 17 years of age has nearly finished the agricultural course in Gardena High and has now taken over the management of his father's poultry ranch with additions of his own.

Gale believes that if chickens alone are good, pigs and chickens together are a better source of income, and so he has added to the 1800 hens and pullets on the ranch several breeding sows, one of them a full blooded Belted Hampshire, and a nice pen of young shoats (that is what they called them when I was a girl). The carrots and stock beets which are raised for the chickens do equally well for the pigs, with the addition of skim milk which he is able to buy at a neighboring creamery for three cents a gallon, and no grain is fed till two weeks before the pigs are marketed. They have the run of an alfalfa patch and are almost literally "in clover." As an example of the profit which can be made on pigs, Gale gave me these figures: He purchased two 40-pound pigs for \$9.00 and sold one of them five months later for \$20. As the feed and labor for both had cost but \$17.50 for the five months his profit on the deal amounted to 50 per cent.

The ranch covers three acres, all of which, except that used for the buildings, chicken yards and pig pens, is carefully planted to green feed. There is a good sized alfalfa patch, a plot of Sudan grass, several rows of carrots, which are cooked and fed in a moist mash to the laying hens, Swiss chard, mangel beets and half sugar beets. The last named are particularly economical because the tops grow again after several successive cuttings. The chard, beet tops and alfalfa are fed morning and evening in a trough along the front of the houses, and the allowance is never skimmed, for the Poultons, both father and son, realize that home-grown green feed, especially in these days of expensive grain, must be the center and foundation of all feeding.

The laying stock is housed in seven laying houses, each 24x18 feet and accommodating 200 hens. These laying houses are combined into three long houses. Mr. Poulton has tried the double yard system but found it a failure because even in a yard 35x180 the 200 hens consumed the green growth almost immediately. He has now reduced the yards to 24x35 and plans to reduce them still more by the use of the Charles Wicks house which he is now trying out. The one house of this type on the ranch is now used for young stock. The chicks are trans-

ferred to it when they are a month old, and because of the peculiar construction of the house, which is in sections eight feet square, with low overhanging eaves and east front and gives a maximum of protection, do well from this time on without heat. At first 75 chicks are put in an eight-foot section. As they grow they are culled to 30. When the pullets weigh three to three and one-half pounds the number is reduced to 25, and when they begin to make comb they are transferred to the laying houses. We saw pullets hatched in January well developed and apparently in full production in June and were told that these pullets do not, if carefully fed, stop laying to molt in the fall.

## STATE LEGHORN ASSOCIATION

With the number of Leghorns in California far greater than all other breeds combined the Leghorn breeders have never formed a state association. Other breeds have had their interests promoted by state and county associations, but Leghorn people have been too busy giving the little egg maker opportunity to do her bit or best.

There was a meeting held Friday evening, June 14, in Los Angeles when temporary organization was formed, to be known as the Leghorn Association of California, and committees were appointed to draft by-laws and report at a meeting to be held at Assembly Room, Los Angeles Times Building, First and Broadway, Los Angeles, Friday evening, July 12. A large attendance of those interested in the Leghorn breeds is desired.

Temporary officers were elected as follows: E. E. Emerson of Burbank, president; Mrs. E. B. Martin of Downey, secretary; Mr. Bogardus of Hollywood, first vice president; John Forney of Kingsburg, second vice president.

A committee on constitution and by-laws was appointed. The committee is as follows: Mrs. E. B. Martin, Downey; W. Z. Webster, Long Beach; Henry Kruckeberg, Los Angeles; Cornele G. Ross, Pomona, and Mr. Bogardus.

At a meeting of the advisory council of the National War Emergency Poultry Federation held in Chicago June 10-11 by-laws to govern the federation were completed and adopted. Permanent officers will be elected and the organization will be completed and greatly extended at the July meeting to be held in Chicago.

The plan of the federation contemplates taking in all national and state organizations having to do with the production or distribution of poultry products and supplies, but the by-laws are framed on such broad and liberal lines that any individual may become a member through his local, state or national organization. A strong effort will be made to enlist the support of every person, firm and corporation having to do with poultry, poultry products and supplies. Further information may be had by addressing Secretary H. V. Lewis, New Brunswick, New Jersey.

The San Bernardino County Poultry Association has been awarded the next annual State Poultry Show of the California State Poultry Breeders' Association. Other associations which sought to obtain sanction for the state show were, Fresno, San Jose and Los Angeles. F. E. Beardslee is president and E. D. Johnston, secretary of the San Bernardino club, and largely through their untiring efforts the show was awarded. Eighty fanciers, members of San Bernardino club, have been voted members of the State Poultry Breeders' Association.

### TREES

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by July 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, California. Phone, Anaheim Pacific 403-J.

**High Prices For Figs**—Insure a large crop of Smyrna figs this year by using plenty of Capris. Make reservation now for June-July delivery of guaranteed Capri Figs. Price \$6.00 per thousand. Write stating quantity desired. L. C. Collins, Ceres, California.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Valencia Oranges and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**SPECIAL SHARPLESS AVOCADO TREES**  
Mother's Avocado Nursery, 137 N. Fair Oaks Ave., Pasadena, California.

**Citrus Trees**—All kinds, any quantity. Butler's Morning Side Nursery, La-Manda Park, California.

**Citrus Nurseries**, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

### SEEDS AND PLANTS

**Tomato Plants**—(Stone) \$2.00 per 1000. Cabbage \$2.25 per 1000. Strong healthy plants, free from disease and insect pests. Buy direct from the grower and secure the best at the lowest wholesale price. Compare prices with local seed house. By parcel post \$0.00 extra per 1000 plants. Take Huntington Park car, get off on corner of Vernon avenue and Hawthorne street and walk one block south. Mail address J. M. Chacon, corner Audrey and Hawthorne streets, Los Angeles, California.

**Bean Seed For Sale**—We have good seed beans on hand of following varieties: Limas, blackeyes, large white, small white, pink, Teparys, Henderson bush, Mammoth bush. Now selling bean bags for fall delivery. C. C. Collins Company, Santa Ana, California. Sunset 71; Home 172.

**Early Amber Sorghum** makes the best silage and produces the greatest tonnage per acre. Recleaned seed 9c per pound f. o. b. Stockton. Fancy recleaned Sudan seed at 18c per pound f. o. b. Stockton, in lots to suit. Aurora Seed Mill, 48 N. Aurora St., Stockton, California.

**Sudan Seed 17½c**, Amber Cane 7½c, Feterita, Egyptian Wheat, Red and White Milo Malze, Hickory King Corn extra good. Dwarf White Milo Malze yields 21 sacks per acre. S. Peruvian Alfalfa. Box 501, Fowler, California.

### FARM LANDS FOR SALE

#### Attention Land Buyers!

Here's an excellent proposition: 40 acre farms selling for \$15 to \$25 per acre, long time payments, 6 per cent interest, in the best agricultural part of Snohomish County, where you have all the modern conveniences, paved roads, railways, schools, churches, mills and factories. This district has proven its worth by the many successful farmers now located there. We also have some beautiful water front 10 acre tracts. OPPORTUNITY knocks at every man's door ONCE, but believe me, it does not continue to knock forever nor does it pound the door down. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

**No. 4501**: 50 acres Maryland mild climate, 5 woodland, 2 fine fruit, near railroad station, school, church and stores; produces wheat, corn, tomatoes, oats, etc. Two story shingle roof frame dwelling, 7 rooms, cellar, front and back porch, barn, corn house, shed, spring house, stable, smoke house, tool house, poultry house, tenant house. Near Baltimore. Price \$4000. Russell Realty Company, Baltimore, Maryland. Catalogue.

**For Sale or Exchange**—60 acres rich, alluvial silt soil. Level. Irrigated, ready for crop. Real alfalfa land. Domestic water on place. Plenty of irrigation water. 1¼ miles from town, churches, grammar and accredited high school. Half cash, half trade, anywhere. Make your proposition now. Chas. McNeely, Alpaugh, California.

**For Sale**—Reader, here is a fine paying ranch, 20 acres, fine stand alfalfa and 5 acres 12 year old Navels and Valencias, a row of lemons, about 2 acres around the alfalfa on county property. All alfalfa sold in field at \$20 per Hay Scales and binder cutting now. See it. Have 60 head Poland-China hogs. Will sell also if desired. J. Frank Bowen, 712 Grant Bldg., Los Angeles.

**Retail Dairy** with modern equipment. 30 select cows, fine 20 acre ranch, beautiful 11 room house, barns, silos, pumping plant and many other things to go with the ranch. ½ mile from high and grammar school. Los Angeles suburb. Address V. Care Cultivator.

**Attention**—Poultrymen—Modern (stocked) plant, small orchard, bunelow home; all conveniences. Big income producer. \$1500 will handle. Will bear investigation, write for particulars. George Ellison, Campbell, California.

**Be Patriotic, Raise Stock** on productive government land, plainly marked on county sectional maps. \$2.50 ANY county. Booklet, particulars for stamps. Write Joseph Clark, Sacramento.

**For Sale**—Fine Paying Lemon and Orange grove, Upland district, none better; 10 acres, ample water stock; good improvements. C. W. Knapp, El Centro, California.

### HOGS

#### BERKSHIRES GUERNSEYS GRAPE WILD FARMS

A few fall boars left by Royal Superbus—also a limited number of fall gilts. We have early spring pigs of both sexes and we are breeding some top gilts for fall farrow. Prices upon application.

A. B. HUMPHREY, Escalon, San Joaquin County, California.

**Poland-China Hogs**—On account of the draft must sell 4 tried brood sows bred to an extra good son of L. B. A. Wonder, 3 at \$75 each and one \$150. Also two yearling sows big, smooth, long and bred \$65 each. Also 4 September Big Bob gilts out of an imported sow will breed to Meddling Wonder \$55 each. One February boar \$50, two at \$35 and two at \$25. 4 February gilts at \$30 each. All recorded, crated and transferred f. o. b. Allen M. Lester, Care N. M. Lester, Gridley, California.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or L. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**"Billiken" Chester Whites**—The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar that is just 13 months old. C. B. Cunningham, Mills, California.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes**, weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Rancho Rubio Durocs**—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

**Mule Foot Hogs**, large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums."

AT

## THE LOCKE SALE

Lockeford, California

Saturday, July 6, 1918

70 Registered Jersey Cows in Milk

15 Unregistered Jersey Cows in Milk

43 Registered Jersey Bulls

EIGHTY-FIVE SPLENDID COWS, and only two blemished udders in the whole herd, and they are on two heifers that are producing enough to hold their own as profitable dairy cows. EMPRESS LASS, the great show cow and producer and VALET'S GOLDEN BIDDY OF L, likewise a great champion in the show ring and a producer at the pail, are only two of the many outstanding females in this sale.

The bull offering includes KING'S VALET IMP., BORELLO'S GOLDEN LADDIE, GRACE'S FOX OF VENADERA, and NORMA'S GERTIE SON OF L, the four Locke herd sires, and a large list of their sons out of the best cows in the herd. More than half the total number are of service age, and many are certain to go at bargain prices. The purchase of just one of these good bulls will repay any breeder or dairyman for the trip to attend this sale.

**CONDITIONS OF SALE**—Every animal positively guaranteed to be a breeder, is tuberculin tested and sold subject to tuberculin retest by the buyer, every animal pledged to absolute sale without reserve or limit.

LOCKEFORD is in San Joaquin County, 7½ miles east of Lodi. Parties from a distance would do well to secure hotel accommodations at Lodi, from which point an auto bus service will operate the morning of the sale.

**SALE WILL BEGIN PROMPTLY AT 9 O'CLOCK IN THE MORNING,** the early hour being necessary on account of the large number of cattle to sell in one day.

Catalog now ready. Write for one.

## Great Stock Sale at San Ardo

Written for California Cultivator By T. C. Mayhew

**T**HE live stock auction sale which the farm bureau of Monterey County held last Saturday at San Ardo was counted by everyone as a success. This sale is the first sale of cattle exclusively which has been held in California. Many hogs have been sold in this way but it remained for the Monterey County farm bureau to have the first cattle sale. It was demonstrated beyond a doubt that the auction system will operate successfully in regard to cattle, and that it is applicable to Monterey County.

The sale was conducted by J. H. Anlotzbehere and J. Rosenberg, who were assisted by W. J. Garthwaite, assistant farm adviser, acting for T. C. Mayhew, farm adviser for this county. Arthur Hebrun of Salinas was present and superintended the grading and weighing, and "Butch" Beevers acted as auctioneer.

Many of the packing houses on the coast were represented, but the bulk of the cattle went to Los Angeles. The cattle buyers were very eager to buy and wanted good stuff. The grade brought in is unfortunately far from being first class beef due to the shortage of feed last winter and was for that reason not wanted by the majority of the buyers. Several feeder buyers attended the sale also, but were unwilling to pay as much as the

beef buyers, their reason being that the cattle offered were not well bred enough to warrant feeding high priced feeds.

There were 140 animals sold, chiefly steers and cows, and the price ranged from \$5.50 to \$9.80, depending upon the grade and kind. The highest steers averaged \$92.20 per head, and the general average was \$75.79. In all the farm bureau sold \$10,610 worth of cattle at this sale. Everybody at the sale expressed himself as highly pleased with the results. The opinion was generally expressed that a higher price was received through the sale than could have been had on the range.

This first sale demonstrated that the auction sale system is a feasible and satisfactory method of marketing beef cattle, that buyers are eager to buy good stuff and to pay a good price for it, that it requires a high grade of beef to get competition among buyers and that feeder buyers want an animal with some breeding.

There were plenty of packing houses represented at the sale, and any number of good beef would have sold, but there were few of high enough grade. After all it was the lack of quality which kept the price from soaring. The packers want good beef, and the cattlemen of Monterey County will have to raise it for them if they would get the top price.

## Jersey Cattle Made Lockeford Stock Farm

Possibly no better example of what a dairyman may accomplish with the right kind of cattle can be found than the results secured at Lockeford Stock Farm, Lockeford, by the N. H. Locke Co. Some years ago N. H. Locke started with 70 acres of land and a small herd of grade Jersey cows that had been bred up from "Durham" or grade Shorthorn cows through the use of registered Jersey bulls. The purchase of a few registered females laid

the foundation for a purebred herd, and the increase from these registered cows gradually displaced the grade females in the herd. All this time the herd was operated as a commercial dairy, under ordinary dairy conditions, and was profitable as such. The profits enabled the owners to gradually acquire more land until Lockeford Stock Farm of today embraces several hundred acres of rich bottom land and upland. Besides making money as a

## 150 Head of Fine Jersey Cows and Heifers 150

## TUBERCULIN TESTED

On the B. & F. Ranch, five miles east of El Monte on the El Monte and Covina Boulevard, three-quarters of mile west of

## BALDWIN PARK

We are instructed by the owners to dispose of this fine herd on above date to the highest bidders

## Positively Without Limit or Reserve

Monday, July 1, at 9 a.m.

And we also wish to call attention to the fact that this fine 87 acre ranch, with abundance of water and good pumping plant together with all buildings and exceptionally good dairy equipment is for lease.

Included in the cows are

## 35 Pure Bred Jerseys

either registered or eligible to be registered. We wish to call particular attention to the fact that nearly all of the cows in the sale were raised on the ranch and are sired by pure bred, registered Jersey bulls, one of which, Frances Victor, is by the great sire Gertie's Lad who has won more premiums than any other Jersey sire on the Pacific Coast. The dam as a two year old produced 467 pounds of butter in one year. The other sire carries a double cross of the World's Champion cow, Brown Bessie. There are 100 milkers in the herd, a number now fresh and giving large quantities of milk, others coming in soon. All are large, young Jersey cows with plenty of type and conformation. There are also six high class Holsteins in the herd. The average test is 5.3: 40 head of fine heifers, sired by the registered sires and out of the best cows in the herd. They range from 10 to 24 months old. Twelve head of heifer calves. This wonderful herd represents the efforts of years of constructive breeding. The herd has been carefully culled and nothing retained that could not show a profit. Seven head of extra good, well bred Jersey bulls including the two above mentioned.

This sale will offer buyers an opportunity to secure the best in Jerseys; don't fail to attend it.

**EASY TERMS:** \$100 and under cash, over \$100, one-third cash, balance in 12 monthly payments with approved note and eight per cent interest. Liberal discount for cash on time sums.

**Star Leader**

## Field Notes from the Live Stock Men

Gotshall & Magruder, Ripon, found some cattle just to their liking in the fourth Sacramento sale, and were able to gather in some very choice granddaughters of King Segis from the McAlister consignment. Their purchases in this sale strengthen greatly the preponderance of King Segis-Pontiac Korndyke breeding already present in their herd.

R. L. Holmes, Modesto, added a number of choice individuals to his select herd of registered Holsteins, in the fourth Sacramento sale. Holmes has displayed unusually good judgment in buying, for a beginning breeder, and has apparently not been tempted to buy the less desirable animals because they were selling low.

E. J. Weldon, Sacramento, again becomes the owner of Ontario Blonde Pietje, for whom he paid \$1700 in the fourth Sacramento sale. Dr. Weldon owned her as a calf, but sold her, and now bought her back from McAlister & Son after she had made a 30 pound record in their hands as a junior four year old. She will be heard from again one of these days as she appears to have a most promising future.

R. C. Sturgeon, Tulare, made a ten strike when he bought the great young bull Segis Pontiac Abbekerk for \$3200 from the Morris consignment in the fourth Sacramento sale. This bull has the distinction of being the only bull in service in California today that is out of a 35 pound dam that made over 34 pounds butter in seven days at her previous freshening. Besides the remarkable records of his dam he has a rich pedigree far back on both sides, along lines that are being actively developed in some of the greatest herds in America. The addition of Segis Pontiac Abbekerk to the remarkable group of Holstein sires already in service in Tulare County marks another step in the progress that is working to bring the community into first place as a Holstein breeding center.

L. W. Bradsley, Tulare, secured an outstandingly good young herd sire in the fourth Sacramento sale, when he bought King Mead of Riverside 7th

from the Morris consignment. As indicated by his name he is sired by King Mead of Riverside, and is out of a 26.76 pound daughter of Changeling Butter Boy that made 16,571.1 pounds milk and 636.80 pounds butter in 316 days, and she in turn is out of a 30.54 pound daughter of Tidy Abbekerk Prince, thus making her 100 per cent the same blood as the 44.43 pound cow Changeling Tidy Abbekerk Wayne. This young sire has developed into one of the best individuals that ever went through a California sales ring, and his rich breeding adds still more quality to the great Holstein blood now present in Tulare County.

Vern L. Heath has leased the Wm. Watt Dairy at Napa and will furnish inspected milk to a high class trade. Heath bought a well selected bunch of registered Holsteins at the fourth Sacramento Sale and bought a number of good grades at the Wm. Watt sale on June 15.

The Price Record for a grade cow in Napa County was smashed to smithereens in the Wm. Watt sale on June 15 when a grade Holstein cow sold for \$252.50. She went to the Carson Indian School, Nevada, which institution also secured a number of the most desirable cows in the herd. Three Nevada men were present at the sale, two of them being buyers. Outside of their purchases the bulk of the cattle went to dairymen in Napa County. The cows sold fairly well, many of the grade Holsteins selling above \$125, but the bred heifers went at unexpectedly low prices, some very good ones going at \$55 to \$65. The Red Cross netted about \$200 from the sale of a pure bred Jersey bull calf donated by Frederick M. Johnson and a grade Holstein heifer calf donated by Wm. Watt. Col. Cy N. Clark of Modesto was the auctioneer, C. L. Hughes, Sacramento, sales manager.

E. E. Greenough of Merced writes that he has recently transferred to J. U. Simmons of Palo Alto the bull calf whose dam is Duchess of Lorina, a line bred Marigold Exile King cow who has produced nearly 300 pounds fat in the first six months of her lactation period. He has also just sold a calf to P. D. Mothorn of Healdsburg, and purchased a new herd bull who is a great grandson of Sophia 19th of Hood Farm, the world's champion dairy cow. Expects to line breed with him along with his Lorna's Exile King bull.

Leeman Dairy is gradually working in pure breds. Ralph Kilgore the manager purchased 11 head of registered animals at the fourth Sacramento sale.

More than 43 pounds of butter in seven days, over six pounds of butter a day, as much butter in one week as the average cow yields in 14 weeks. That's the record of this stately Holstein matron of the dairy world who goes by the name of Tietje Queen De Kol 2d 228996. Tietje finished a seven day official test with a production of 639.3 pounds of milk yielding 43.29 pounds of butter to her credit. She freshened at the age of four years, ten months, 26 days. She is the thirty-second purebred Holstein cow to enter the charmed circle of cows that have produced more than 40 pounds of butter in a week. Her sire is Sir Pontiac Korndyke 6th 66229; her dam is Tietje Queen De Kol 95772. This is the second daughter of Tietje Queen De Kol to make better than 42 pounds of butter in a week, and the dam herself has a 42 pound record, which makes this trio an exceptional family. Tietje Queen De Kol 2d was bred by W. L. Keyes, Deerfield, New York, and is now owned by A. C. Howe, New Hartford, New York.

## Hog Wallows

Some farmers favor hog wallows; others are strongly opposed to them. Filthy hog wallows are a constant source of disease. Hogs wallowing in or drinking contaminated water are likely to contract disease. However, there are many advantages to be derived from wallows. A cool bath is very soothing to a hog in hot weather. It cleans the scurf from the skin and protects the hogs from flies. Crude petroleum, sufficient to form a thin layer on top of the water, may be poured in the wallow about every ten days. One man in this state has a concrete hog wallow built so that he can drive his whole herd through it every two weeks. He has kept dis-

ease down in his herd and he carries upward of 1000 head. The concrete hog wallow should be located in a shady place and made so as to contain from eight to ten inches of water. A two-inch drain pipe should be placed in the bottom of the wallow to permit its being cleaned out. And do not forget to clean it out occasionally.

In many cases a farmer is not financially able to build a hog wallow or a dipping vat. In Arizona provide plenty of shade. Also apply the dip with a spray pump or sprinkling can, or else rub on every part of the body by means of a brush. Do not apply the dip stronger than directed.—W. E. Schneider, Swine Extension, Tucson, Arizona.

## Specializing on Berks

W. F. Sandercock, who is interested in some of the rich Natomas lands on the outskirts of Sacramento, conducting a campaign for making those Na-

convert and he has just secured some of Frank Brush's prize winning stock. We have always believed in centering on one breed so far as possible in

Three Aristocrats

Frank Kiesel and three of his favorite Berks recently installed on his Sacramento Ranch.

tomas lands famous as producers of famous Berkshires. He has not only secured fine foundation blood for his own ranch but is inducing others of that section to specialize on the Berkshire. Fred W. Kiesel is the latest

every community. Prospective buyers of pure bred stock are more liable to seek out an enthusiastic community of breeders than they are to go from place to place to find individual breeders.

## Ayrshire Breeders Lose Secretary

In the passing of Mr. Winslow, secretary of the National Ayrshire Breeders Association, America loses one of its pioneer dairymen. He was a charter member of the National Ayrshire Breeders' Association, organized in 1875, and was responsible for the incorporation of the association in 1886. He was elected secretary-treasurer in 1882 and has been annually re-elected since. For 35 years he has steered this association through stormy times until today it is out in

the clear and headed forward. Mr. Winslow was a keen breeder and his exhibits at St. Louis and other national expositions were always to be reckoned with.

Mr. Winslow for many years was president of the New England Agricultural Society. He was a member of the Vermont legislature in 1894-5 and secretary of the state board of agriculture. He was for many years president of the New England Ayrshire Club and the Vermont Ayrshire Club and prominent in town affairs.

## Jersey Record Breakers

In the last report of "Jerseys Breaking Records Everywhere" we note there are no California animals, but Washington does come to the front with:

Eminent's Foxy Belle 304982, owned by J. P. Graves, 14,920.6 pounds milk, 816.65 pounds fat, three years, 11 months old; Brooketta 294025, owned by Glendale Creamery Company, 14,139.5 pounds milk, 705.01 pounds fat, four years, three months; Maysie's Fern Lassie 290819, owned by J. P. Graves, 15,606.3 pounds milk, 803.06 pounds fat, four years, five months; The Owl's Golden Queen 275736, owned by E. L. Brewer, 14,226.8 pounds milk, 918.41 pounds fat, six years, eight months Genesta's

Duchess 266615, owned by J. P. Graves, 15,293.9 pounds milk, 901.79 pounds fat, 7 years, one month.

Most conspicuous among these records is that of The Owl's Golden Queen in the state of Washington. This state can be proud of three new records, one of which was broken twice within two months. The name of Genesta's Duchess is also added to the above list, to give deserved prominence to the great quintette of cows that have just finished yearly records for a total production 4164 pounds of fat, or an average of 832 pounds of fat. This average for five cows exceeds anything that has ever been recorded from one state within a similar period of time.

# APPLETON Silo Filler

## The best silo filler improvements ever made

—that's what you'll say when you find out about the new Appleton features that save time, labor and money. Thousands who have used the Appleton have proved that it does more and better work per hour than other silo fillers; that it is practically trouble-proof, is safe, requires the least power to run it; and stands up far longer. These facts are from the statements of actual users. Now the

new features make the Appleton the best value ever built.

Be sure you find out all about it.

SILOS

Appleton Silo Filler

## HAY

Under date of June 22, Scott, Magner

&amp; Miller says:

Receipts past week, 2116 tons. Some of  
the better grades of new hay of wheat  
and wheat and oat have arrived during  
the week, although no new tame oat hay  
has been in evidence, the majority of the  
receipts consisting of wild oat, oat and  
barley, barley hay and alfalfa. There is  
so little old hay now arriving that here-  
after we will quote on the new crop only.  
Owing to the drouth this year, a great  
deal of the hay is short and carries con-  
siderable dirt which, especially when  
prices are high, causes considerable com-  
plaint. We believe this season we will  
have this trouble to a great extent. Bal-  
ing is somewhat backward owing more  
or less to unsatisfactory labor conditions.

We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers upon the hay market—for  
prices to consumers charges of cartage,  
commission and handling must be added  
according to conditions:

## GRAIN

Wheat—Government prices: Common  
white hard, base price, \$3.50 per cental,  
or \$2.10 per bushel of 60 pounds deliver-  
ed in terminal warehouses in bulk; soft  
white, base prices, two cents per bushel  
less, or \$2.08 per bushel; white club (In-  
cluding Sonora), \$2.00 per bushel. If  
wheat, after cleaning, weighs 60 pounds  
or more to bushel, base price stands; if  
58 to 60 pounds to bushel, three cents per  
bushel reduction; if 56 to 57 pounds six  
cents per bushel less; if less than 56  
pounds, grain becomes sample grain and  
sells on its merits up to within one cent  
per bushel of 56-pound wheat. Addi-  
tional charge made for sacks.

## SEEDS

Prices in round lots, lb.:  
Millet, recleaned .....5@5½  
Alfalfa, lb. ....20@21  
Flax .....7@7½  
Hemp .....5@5½  
Rape .....2½@3

## Citrus Fruit Market

Los Angeles, June 26, 1918.

Orange prices have declined slightly be-  
cause of immense quantities of cantalou-  
pes, peaches, and other fresh fruits in  
all markets. The demand for orange  
juice beverage is increasing.

Approaching Fourth of July has in-  
creased the lemon demand but abnormal  
prices have not obtained as they did last  
week.

## Shipments

Shipments of citrus fruits to date since  
November 1, 1917: Southern California;  
oranges 11,467, lemons 3826, total 15,293.  
To same date last season oranges 30,967,  
lemons 5752, total 36,719. Central Califor-  
nia this season: oranges 2533, lemons 115,  
total 2648. Last season to same date;  
oranges 4511, lemons 164, total 4675.  
Northern California; oranges 203, last  
year same date, 845.

## AT THE AUCTIONS

## June 19

New York: 13 oranges, 2 lem. Val.  
3.25-7.15, lem. 7.30-8.60.  
St. Louis: 3 oranges, 2 lem. Val. 4.30-  
6.70, lem. 7.75-10.50.  
Pittsburg: 5 oranges, 2 lem. Val. 3.95-  
6.35, lem. 6.70-7.25.  
Boston: 10 cars. Val. 5.15-8.85, grape-  
fruit halves 1.35-1.70.

## June 20

New York: 15 oranges, 1 lem. Val.  
3.25-7.55, lem. 7.50-8.00, Sweet's 2.95-4.35.

Philadelphia: 3 oranges. Val. 4.25-6.50.

From post card reports to the Los An-  
geles branch of the bureau of markets,  
United States department of agriculture,  
report is made of the following shipment  
of cars of products from California for  
the week ending June 17: Apricots, 173;  
artichokes, 3; cabbage, 28; cantaloupes,  
7; cauliflower, 1; cherries, 37; cucumbers,  
6; dried beans, 10; dried peaches, 3; dried  
pears, 2; dried prunes, 18; green string  
beans, 1; lettuce, 7; logan berries, 28;  
mixed fruit, 76; mixed vegetables, 47;  
mixed fruit and vegetables, 6; onions,  
147; peaches, 46; plums, 62; potatoes, 285;  
raisins, 90; watermelons, 6.

Partial list of California fruit  
and vegetable shipments

MARKET NOTES

Los Angeles, June 26, 1918.

Bureau of Markets, United States de-  
partment of agriculture from its local of-  
fice gives the Cultivator the following:

Apricots

Apricots are bringing \$40 per ton in  
northern sections; local stuff about Los  
Angeles is not yet started to any great  
extent, except for green market, most  
needs are met by stuff coming from the  
North. Apricots are not one of the licens-  
ed dried fruits. Dried apples, raisins and  
dried peaches and prunes the war and  
navy departments are strong buyers for,  
but not for apricots.

Cantaloupes

Receipts of Imperial Valley cantaloupes  
are increasing. Much ripe stock is now  
being offered, which tends to depress the  
market. Standards have declined from  
\$2.50 to \$2.00, with poorer and overripe  
stock running from \$1.25 to \$2.00 accord-  
ing to condition. Local market is begin-  
ning to feel for the first time this season  
the usual effect of receipts of over-  
ripe stock. White rinds, or so-called  
Honey Dew, jobbing from \$2.25 to \$2.50,  
with slow demand.

Potatoes

Old stock is gradually cleaning up,  
prices remaining steady for Shimas and  
a few Idaho Russets, which are jobbing  
at \$1.50. Receipts of home grown new,  
Garnets and White Rose varieties, are  
increasing and jobbing at 50 cents per  
lug box. This new stock is showing fair  
quality, but much of it is poorly graded.  
The general opinion is that the digging  
of potatoes in war gardens is beginning  
to affect the movement of new potatoes  
in the wholesale market and jobbing de-  
mand has declined somewhat during the  
week. Growers of commercial acreage  
are receiving from \$1.25 to \$1.35 per hun-  
dred from jobbers of carload lots, and the  
demand in the Northwest for this new  
stock is moderate. Most of the fields  
are digging much lighter than anticipat-  
ed. The general tone of the market  
shows a slightly stronger tendency.

Onions

Coachella onions are nearly cleaned up  
and the old Australian Brown from  
Stockton are off the market. New stock  
from Stockton not yet in appearance al-  
though the first car is expected within a  
few days.

Peaches

Local receipts have been light. The  
quality has been unattractive and peaches  
of good size and good condition have not  
yet been seen.

## BETTER FARMING

The Samson Sieve Grip Tractor Com-  
pany has issued "Better Farming," a  
most attractive booklet which is largely  
made up of illustrations of the Sieve  
Grip tractor in action in orchards, vine-  
yards, and fields, also used as stationary  
power, and with other illustrations show-  
ing various parts of the mechanism of  
this effective tractor. The title of the  
booklet should prove true to name, for  
the use of the Sieve Grip in farming cer-  
tainly leads to better farming.

### SINCE PA QUIT TINKERING

When first we bought our auto, Pa would often lift the hood and tinker with a lot of things he never understood; They gave a pair of pliers with the tools that they supplied, And that little set of nippers was his pleasure and his pride. He tightened this and loosened that, a dozen times a day, Then wondered why the car we owned got stalled along the way.

The carburetor interested Father quite a lot, He changed it when the days were cool and when the days were hot, And when the car was running well and when it seemed to jerk; But Mother said he never gave the thing a chance to work. He fussed with it for everything that stranded our machine; He even blamed it once when we ran out of gasoline.

The monkey wrench was his delight; he'd spend each Sunday morn In taking that old car apart, from muffler to the horn; He'd smear himself with oil and grease and count his labor fun, Then wonder why, that afternoon, the motor wouldn't run. He used to stay at home at night to read his book of rules, Because he seemed to think he had to use that set of tools.

As time went on though, Father learned to leave the car alone; Today he never lifts the hood of that machine we own; So long as it will run at all Pa lets it jog along, He leaves the tools beneath the seat and will not touch a thing, And we are all enjoying life since Pa quit tinkering.

—By Edgar A. Guest.

### THE CONSCRIPT

By Clarence B. Kelland, in Milestones

**Y**OUNG SIMS maintained publicly an attitude of indifference toward the war; but he was far from indifferent. He walked about and worked and ate his meals with fear for a companion — fear that he would be drawn into the war. When conscription became a fact he knew the sensations of the condemned man, for he was 23 years old, exceedingly able-bodied, without responsibilities—ideal soldier material.

Friends had long before enlisted, or had been accepted for training at Plattsburg. Sims knew their example was an accusation pointing at him, but he dared not follow, for he was afraid, physically afraid of the things that war meant to the individual soldier. It was not so much that he was afraid to die; he was afraid to suffer. He was afraid of hardships in the trenches, afraid of wounds. Most especially there lurked in his mind the thought of vicious machine guns pouring upon him a spray of death, and of blood-lusting men rushing down upon him with fixed bayonets.

An uplift of patriotism had laid its hand upon the land. Sims had felt it. He thrilled at the sight of waving flags, at the thought of the greatness of his country in the world's emergency; of the loftiness of her motive in setting men to march behind her flag. It was not that he was a pacifist or a peace-at-any-price man. He believed in the war, in the justice and necessity of it—but was afraid to do his part. Shame was his companion as well as fear.

Now he was running away from the draft. He had slunk out of the town between midnight and dawn and was heading back into the fastnesses of the mountains, a fugitive, a deserter. The stigma of it rode his back and clutched his throat—his country had commanded and he refused to obey. More than once he stopped, turned and faced toward the town, setting his will to drive him back to his duty. But each time fear overrode will and he pointed his steps again toward the mountains, cursing himself bitterly for his cowardice.

"I can't do it . . . I can't go through with it," he groaned through his set teeth.

It was noon before he met a human being on that lonely, little traveled road. Beside the faint wagon ruts sat two big, uncouth young men eating a meager lunch. Across the knees of one was an ancient smoothbore rifle; the other sat within easy reach of a cheap, single barreled shotgun.

"How be you?" said the nearest young man.

Sims nodded in reply.

"Travelin' fur into the hills?" asked the young man with the rifle.

"Quite a ways," said Sims.

"You're headin' wrong to go soldierin' if that's what you're lookin' for," said the owner of the shotgun.

"Are—are you looking for soldiering?" asked Sims.

"Calc'late to be. First off jest one of us was comin' on account of leavin' Ma alone. But she figgered we better both go together. So we fetched our guns and here we be. . . If you

come t' Ma's house along about night you might let on you seen us and we was lookin' hearty and feelin' fine."

"Where does your mother live?"

"Keep to this road till you cross the covered bridge. Then turn to the left and up the hill. Ma perches high," said the young man with a grin. "Calc'late it's nigh to ten miles from here."

"She might allow me to stop there for the night."

The young strangers exchanged glances, then one of them said cordially, "'Course she would. Ma'd be glad to have you."

Sims trudged on, walking easily, his huge frame carried as lightly as a man of half his weight. Somehow his size made his cowardice seem that much more degrading.

Dusk had fallen when he climbed the sharp incline of the road to a little shabby-white house among the spruces. There was a light in the rear. Sims rapped on the kitchen door. There was a moment's silence, then a clear voice said challengingly, "Who's that?"

"Just a young man tramping through the hills," said Sims. "I met your sons this noon—they sent a message."

The door was thrown open and Sims stood face to face with a woman who seemed incredibly young to be the mother of grown men.

"I—" he stammered and hesitated, "perhaps I'm at the wrong house."

### The Crystal Plunge at Forest Home

**A**FTER a long hike along Mill Creek and up the many mountain trails among lofty pines there is nothing so refreshing and invigorating as a dip in this crystal plunge.

Forest Home is ideally located 16 miles from Redlands and 86 miles from Los Angeles, in the still depths of the mountains on roaring, tumbling, crystal Mill Creek, 5200 feet up in the San Bernardino range.

Forest Home is not a full dress resort, but a delightful place for real folks who enjoy comfort, rest and a good time.

The Hotel is conducted on the American plan. Mountain trout dinners on the regular bill are served at least once a week, and the best the market affords is served in an appetizing manner.

You can have a housekeeping tent or cabin, supplied with all the necessities of a comfortable mountain home, if preferred.

For information and reservations write direct to

When writing advertisers, mention 'The Cultivator.'

"No—come in. Them was my boys. One had a rifle, the other a shotgun?"

"Yes. They said to tell you they were all right and feeling fine. . . . They said, too, that you might be willing to give me a bed for tonight."

"My goodness, you're big," she exclaimed as he entered. "'Course I'll give you a bed. Now that the boys is gone I don't mind confessin' I'll be glad to have a man in the house this night—especial one of your size. More so since I clean forgot about goin' down to Manney's and borrowin' a gun. . . . Boys wanted I should keep one of their guns, but I says no to that. You see we been hearin' how the goverment was short of guns and ammunition, so I made the boys take theirs right with them. . . . Set, and I'll put on a drawin' of tea."

"What do you need of a gun?" Sims asked uneasily.

"Oh, I won't need none with you here," she said, "But them Hobbs' Crack men might take a notion to come over and git even, seein' the boys is away. Kind of a bad lot, them Hobbs' Crack men. Got a grudge agin us owin' to the boys puttin' some of 'em in jail for one thing and another. Once in a while they get full and come over to pay us a visit, but the boys gen'ally looks after 'em plenty." She said that with apparent pride.

Sims frowned. It was probable the woman was overstating the peril of her situation, or she would not have let both her stalwart sons leave her to face it alone. 'Hobbs' Crack he had heard of through the wagging tongue of rumor; it was a tiny, sordid, law-flouting settlement back in the hills—and dark tales were told of happenings there. If it were true that Hobbs' Crack harbored a grudge against this household then, thought Sims, there was very real danger. Burned houses, cruelly horsewhipped men and women were whispered of as the victims of Hobbs' Crack's debt-paying. But no such horror could be hovering over this house. No woman could remain tranquil as this woman was; no woman could send away from her sure protection. . . .

"If there's danger of their coming," he said, "I can't understand your sending away your sons—your not keeping even a gun."

"Hobbs' Crack will come—if it knows they're gone," she said simply. "I didn't want the boys should go. No mother would. But, the way we hear it, the country needs them. I thought it over and prayed it over, and it seemed to me like our country deserved pretty well of us. It come to me in the night that if there was anything I could do, or give up, or risk—why, I jest had to do it."

"Do you mean," he asked incredulously, "that, knowing perfectly well the danger you would be left in, you let your sons go away to enlist? You allowed yourself to be left alone and defenseless—because the country needed men? Don't you think you needed them worse than the country?"

"That wasn't for me to judge," she said. "It hain't for any of us to set up our own wants and fears at sich a time. Don't every boy that enlists go into danger? He knows he's like to be killed or wounded. Well, us that stays home shouldn't ask more'n they do. If they're willin' to face death fightin' for our country, we ought to be willin' to face it so's they kin go to fight."

Sims looked around the meagerly, roughly furnished room. It spoke of poverty; it lacked essential comforts; it was not the home of a family which

had prospered or known the smile of fortune.

Sims spoke his thought involuntarily: "What has the country done for you to deserve so much from you?"

"I dunno's I kin explain it to you," she said quietly, "if you don't know. Don't you set a heap of store by your country?"

"Yes," he said.

She nodded. "So does my boys and me. Partly, I guess, it's because it is our country. It's a country that's strivin' to do right in the world. It's a country that's workin' constant to make folks safe and comfortable and happy. . . ." She stopped a moment and looked toward the window as though it were light and she could see off across the hills and valleys and streams and forests that lay there in amazing panorama. "And it's so beautiful. . . ." she said, and stopped.

Sims was convinced. Here was a love of country that would sacrifice its all blindly. . . . He believed now in the danger from Hobbs' Crack. He believed the woman had remained to face it alone as she said she had. He believed it, and shame overwhelmed him. What would she think of him, a craven, a deserter, fleeing from the thing to which she had serenely sent her sons? She willingly faced not only dangers from brutal men, but the struggle for life itself—that two men might serve their flag!

"You'll be tired," she said. "I'll show you the boys' room. You kin sleep there. When I hear you movin' about I'll pertend it's the boys. . . . That'll make me sort of happy."

She took the hand lamp and led the way into a tiny room, neat, kept spotlessly clean by loving hands.

"Here's where they've slept," she said, "almost since they come into the world. . . . I'm playin' they'll sleep here again; but if not—if it hain't to be that they come back from the fightin'—I calc'late I'll know it was for that I bore them and reared them, and I'll be able to set and look out at the hills and thank God I had two to give. . . ." She brushed her eyes unobtrusively with her hand. "You're big," she said. "You'll be goin' to the fightin' too, but I'm glad you're here tonight, for after all I hain't nothin' but a woman. . . . Good night."

"Good night," he said, and stood looking at the door that closed behind her. Shame, bitter, biting shame, was the cup he drank; shame that he was as he was; shame that the fear which disgusted, yet fettered him, would not let him be other than he was. . . . He was afraid even, to stay here. Those men might come! They would come armed, brutal, ruthless. Already in his secret heart, he knew he was going to be guilty of another desertion—he was about to desert this serene-hearted, much deserving woman in the hour of her peril.

(To be Continued.)

### BEHIND THE TIMES

"That is the big dipper."

"Yes, ma."

"And yonder is the little dipper."

"But, ma!"

"What is it, Harold?"

"Have they no individual drinking cups?"

Send our boys the fuel, and they will supply the steam.

8851

8855—Ladies' Shirtwaist. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The sleeves may be made either long or short.

8637—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. A pretty lace-edged collar finishes the neck.

8887—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The collar is curved to follow the neckline, and one end slips through a slash at the front.

8139—Ladies' Shirt Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. This simple shirt waist has a V-neck and it may be finished with frill of lace on collar and cuffs.

8870—Girls' One Piece Dress. Cut in sizes 4, 6, 8 and 10 years. The dress hangs straight, and the front and back panels curve to form pockets at the sides.

8884—Ladies' and Misses' Sailor Dress. Cut in sizes 16, 18 years, and 36, 38, 40 and 42 inches bust measure. The blouse and skirt may be made with or without the applied yoke.

8851—Ladies' and Misses' Two or Three Gored Petticoat. Cut in sizes 16, 18 years, and 26, 28, 30, 32, 34 and 36 inches waist measure. The petticoat may be made with two or three gores.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

### HONEY RECIPES

Written for California Cultivator  
By Mrs. R. F. Reasoner

In response to request by subscriber for honey recipes:

#### Honey Cake

Cream three tablespoons sugar with three tablespoons butter. Beat in one egg or two yolks. Add two-thirds cup honey, a pinch of salt, one-half teaspoon ginger, one teaspoon cinnamon, two tablespoons chocolate dissolved in one cup hot water. Add one teaspoon soda, one teaspoon baking powder, one cup barley flour, one cup white flour. Bake in two layers.

#### Honey Caramels

Two cups granulated sugar, one-half cup milk, one-quarter cup honey, one-quarter cup butter.

Mix ingredients; heat, and stir un-

## SUGAR MUST BE SAVED!

A teaspoonful means nothing. You say. Yet a heaping teaspoonful saved each meal for 120 days for each of the 100,000,000 persons in the United States makes a pile as big as the Woolworth building—enough to supply the entire armed forces of the nation.

til sugar is dissolved; then cook without stirring until a firm ball can be formed from a little of the mixture dropped into cold water. Beat mixture until it crystallizes, pour into buttered pans, and cut into squares. Pecan nuts are an improvement.

### WHEATLESS RECIPES

Written for California Cultivator  
By Mrs. C. L. Gardner

#### Wheatless Raisin Bread

One cup white corn flour, three-fourths cup rice flour, three-fourths cup barley flour, one-half cup buckwheat flour.

Sift flours together twice with one teaspoon of salt and five even teaspoons of baking powder.

Stir in one generous cup of raisins. To these dry ingredients add two well beaten eggs mixed with one and three-quarters cups of milk and one tablespoon of Karo syrup. Put in well greased pan and leave in a warm place for 30 minutes. Bake in moderate oven for 45 or 50 minutes.

#### Cottage Pudding

One-half cup rice flour, one-half cup barley flour, one-third cup buckwheat flour, two-thirds cup white corn flour, one-fourth teaspoon salt, three teaspoons baking powder, sift together thoroughly. Beat one egg and half a cup of sugar together, then add to dry ingredients alternately with one cup of milk. Lastly add a tablespoon of melted shortening. Eat hot with liquid sauce.

#### Plain Cake

One-fourth cup shortening, three-fourths cup sugar, two eggs, five-eighths cup milk, one-half cup white corn flour, one-fourth cup buckwheat flour, three-eighths cup rice flour, three-eighths cup barley flour, one-fourth teaspoon salt, three teaspoons baking powder. Beat eggs light, then add sugar to them. Sift dry ingredients together twice, then add to the sugar mixture alternately with the milk. Melt shortening and stir in last. Flavor as desired.

## All the Year Round

A New Perfection Oil Cook Stove in your kitchen means better and more economical cooking all the year round.

More convenient than coal or wood. Lights at the touch of a match and heats in a jiffy.

No smoke or odor; no dust or dirt. Economical.

And all the convenience of gas.

In 1, 2, 3 and 4 burner sizes, with or without ovens or cabinets. Ask your dealer today.

STANDARD OIL COMPANY  
(California)

## NEW PERFECTION OIL COOK STOVE

A New Perfection Oil Cook Stove means kitchen comfort and convenience. Ask your friend who has one. Used in 3,000,000 homes. Inexpensive, easy to operate. See them at your dealer's today.

Refreshing Outdoor Mineral Plunge at Wheelers.

**M**OST of your time is mortgaged to work, meals and sleep. Once a year at least you owe yourself a rest and vacation that will fit you for the next season. What could be more delightful than to spend a week or two at Wheelers—high above the fogs,—on the banks of a beautiful stream in the Ventura Mountains?

Everything here is conducive to health—Hot Tub Baths, Big out-of-door swimming pool, dancing, horse back riding, fishing, and when it comes to meals—Wheelers Hot Springs sets before you as appetizing meals as can be found anywhere in the mountains—they are great. Come up and bring the kiddies. Daily auto stage from Los Angeles to Springs. Write for new folder.

"Open Year Round"

## Help Fight the War in the Cornfield

Save  
100 Per Cent  
of the  
Corn Crop

You can do it with a concrete silo, and keep green fields on tap through the winter.

A concrete silo prevents the 40 per cent waste of the corn crop that happens when corn is harvested in the old way.

You should have a *concrete silo* because it is rotproof, ratproof, windproof, fireproof, permanent.

Write for Bulletins Nos. 55 and 56

Concrete for Permanence

Correct Lubrication for the Ford Engine  
The Ford automobile engine, illustrated here, like all internal combustion engines, requires an oil that holds its full lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLINE LIGHT fills these requirements perfectly, because it is correctly refined from selected California asphalt-base crude.

### "Zerolene is the Best"

—Say leading motor car distributors, because the records of their service departments show that ZEROLINE, correctly refined from selected California asphalt-base crude, gives perfect lubrication with less wear and less carbon deposit.

Most cars are now lubricated with ZEROLINE because their owners have learned through experience that there is no better oil.

ZEROLINE is the correct oil for all types of automobile engines. It is the correct oil for your automobile. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

When writing advertisers, mention The Cultivator.

## Increasing the Value of the Farm by Bringing it Miles Nearer the Market

The value of a farm depends largely upon its distance from a good market. Today distance is measured in minutes, not in miles.

The Patriot Farm Truck (Lincoln Model, 1½ tons capacity) readily transports much more in weight with

several times the speed of a horse-drawn wagon. It lays down at market 15,000 to 20,000 pounds in practically the same time that a team will deliver 5,000 pounds, literally bringing the farm to about one-fourth its actual distance from market.

## PATRIOT FARM TRUCK

Built for Country Roads—Built for Country Loads

The Patriot is the first motor truck built for farm work, and is equipped with a practical farm body, similar to what you have always used on your farm wagon. It saves horses and high-priced feed. It brings better markets nearer, for with a Patriot you can readily drive loads to a market fifty or one hundred miles distant.

Business farmers can easily see how such perfect transportation greatly increases the value of their farms, to say nothing of the convenience in being master of roads and weather. Every farmer with 160 acres or more should find out what a Patriot Farm Truck will save. Write for information.
